ZX99

AUTOMATIC TAPE CONTROLLER FOR THE SINCLAIR ZX81

● DATA PROCESSING

The ZX99 gives you software control of up to four tape drives (two for loading, two for writing) allowing merging of data files. This is achieved by using the various markers of the tape drives, controlled by LSR statements or commands.

● RS232C INTERFACE

The ZX99 has an RS232C output allowing connection with any serial printer using the full ASCII character code. You can now print on plain paper in upper or lower case, and up to 132 characters per line at a variable baud rate up to 9600.

● SPECIAL FEATURES

There are so many special features it is difficult to list them all. For example:

AUTOMATIC TAPE COPY: You can copy a data file regardless of your memory capacity as it is processed through the Sinclair disk to disk.

TAPE BLOCK STOP: Without destroying the contents of RAM.

DIAGNOSTIC INFORMATION: To assist in achieving the best recording settings.

The ZX99 contains a 2K ROM which acts as an extension to the firmware in the Sinclair ROM. The ZX99's ROM contains the tape driver operating system and the connection to ASCII for the RS232C output.

There is an extension board on the rear to plug in your RAM pack (larger than 16K if required). This unit is supplied with one special tape drive lead, more are available at £1 each.

NOW ONLY

£49.95

PLUS
£2.95 p&p

● ZX99 SOFTWARE

We now have available 'Editor 99' - a quality word processing program, including vital merge, supplied on cassette for £3.95. Also forthcoming soon:

- * Basic Control (Standard)
- * Sales Ledger (Monthly)
- * Debtors Ledger
- * Business Accounts
- * Tax Accounting

CONTENTS

Letters 8

You, our readers, speak out on matters that interest, irritate, infuriate, plague and involve you. Tim Hartnell replies.

Hints 'n Tips 12

A very useful collection of very useful things you should know when writing those very useful programs!

Foxing About 20

No wiles of phoning out of this exciting game! Time to get busy and get the bird in a trap chase!

Adding a Keyboard 24

Put up with the ZX cramps? Make life easier for yourself by adding a customised keyboard to your ZX Computer. Finger clicks, gone!

Slot Machine Fever 26

A 184 program for the ZX81 that will let you get the chips on the bank. Lots of fun with some clever graphics.

ZX Computing is published on the basis that each writer retains and warrants all rights in any work that they submit to us and that we shall have the right to publish and to use all or any part of it in any form without limitation of time or territory. We warrant that the work is original and that it does not infringe any copyright or other intellectual property rights. Any material which is submitted to us shall be deemed to be submitted to us for publication and we shall have the right to publish it in any form without limitation of time or territory.

Micros and a Bus 31

Not the ZXA to Kilburn High Road but the S100 to printers or 'ADU' ZX Computing takes the mystery out of I/O.

Ready, Steady, Go! 32

Stopwatches at the ready as Stephen Tyler and Mark Dalling put some popular computers to through their paces.

Hardware Reviews 35

Three pages of goodness to expand your ZX horizons. Plenty to talk about here - or our reviewers found out.

Yellow ZX of 80! 38

A little story from Sweden's Juleversion of The Yellow Rose of Texas for the ZX80.

Ground-To-Air Missile 41

No prizes for guessing the sort of this exciting and fast-moving game. The prize is for being straight - and fast.

Moving with the Flow 42

Flowcharts are an essential part of learning to write large programs. If properly used they generate good routines. Here's how.

What is Your Defence? 45

Save the Earth (again!) or any other planet you fancy with this ingenious space opera offering.

Board Game Design 48

The secret of how to make your ZX think it's a chess master, an agent, or a star fighter - and win!

Hit the Deck 56

Put your wits against the ZX wind engine to land your plane on the aircraft carrier. A must for all scoring pilots.

A Little Joy 59

Moving things around never gets any more fun for the ZX81. Is the convenience worth the cost? We find out.

A Test of Nerves 60

So you think you're James Hunt, huh? nah! This program will test out the Sunday drivers!

Going Gregorian 62

Make a date to make dates with our informative program to handle your day.

News 65

Five pages of all the latest and greatest things to happen to ZX computers. If it matters, it's here!

Doodlebug 69

An ingenious little game with a novel programming twist.

Getting some Order 72

Our editor has devised two invaluable programs for the ZX81 and Spectrum to help you get organised.

Software Reviews 74

There are hundreds of programs available for the ZX computers. We show you some of the best.

Navarone Ablaze . 78

Time for Spectrum owners to show themselves into the AA guns, dry their sails, and prepare to do battle!

Structured Programming ... 82

About time you improved your programming! We all ought to do things properly. Now you can!

All in Proportion . 84

Screen are tricky things to put into typewritten copy. Design proportionally into much harder (and new ZX 81's solve the problem).

Away into Space . 85

A thrilling new game guaranteed to bring out the Captain Kirk in you!

High Security 88

Try and outwit the guards and get to the treasure in this 'High Intelligence' game for the 16K ZX81. By Paul Holmes.

Magic Dollar 90

Escape from the clutches of the ZX81 before it traps you in this clever game!

Spectrum in Code . 93

Master machine code mysteries on your multi-colour monitor. This article makes it easy and fast.

Secret of Life! 97

Don't say you never wanted to know it! Everybody does — and now your ZX81 can be made to reveal it!

Ideal for Schools? . 98

We take a look at the ZX in the classroom.

Watts That? 103

A 16K program that is ideal for physics students who are overjoyed with calculations.

AC Series Circuits 104

Make your ZX drive defects and calculate the values for you. Ideal for electronics fans everywhere.

ZX-81 Tape Directory 108

A quick and easy way to store programs on a tape and be able to find them again — fast!

Linear Programming and OPTIMAX ... 111

A program designed to give the ZX81 owner access to a decision-making technique.

Along the Wire . 114

Two challenging 16K programs from Daniel Hayward. Including an expensive device for storing these pictures you so created.

Computer / Instructor 118

A list of teachers to tell you all you need to know.

Battle of the Chessmen 120

Two of the best chess programs on the market do battle in this ZX Computing review. Who wins out?

Make Your ZX Work! 122

When your ZX 81 tires of playing games, make it earn its keep with this utility program.

Worth 1000 Words? 124

Potomac point the way to a more impressive display!

Specifications . 128

Our invaluable quick reference guide to the ZX ranges of computers and peripherals. All the facts.

Sinclair ZX Spectrum

**16K or 48K RAM...
full-size moving-
key keyboard...
colour and sound...
high-resolution
graphics...**

**From only
£125!**

First, there was the world's best-selling Sinclair 2068. The first personal computer for under £100.

Then the 2068. With up to 16K RAM available and the ZX Printer (giving more power and more flexibility). Together, they're sold over 500,000 units a year. To make Sinclair world leaders in personal computing. And the 2068 remains the ideal low-cost introduction to computing.

Now there's the ZX Spectrum. With up to 48K of RAM. A full-size moving-key keyboard. vivid colour and sound. High-resolution graphics. And a low price that's unrivalled.

Professional power— personal computer price!

The ZX Spectrum incorporates all the proven features of the 2068. But it's new 160K BASIC ROM dramatically increases your computing power.

You have access to a range of 8 colours for foreground, background and border, together with a sound generator and high-resolution graphics.

You have the facility to support separate data files.

You have a choice of storage capacities (governed by the amount of RAM). 16K of RAM (which you can upgrade later to 48K of RAM) or a massive 48K of RAM.

At the price of the Spectrum 16K, it's an amazing £125 (even the popular 48K version costs only £175).

You may decide to begin with the 16K version. If so, you can still return it later for an upgrade. The cost? A round £65.

Ready to use today, easy to expand tomorrow

Your ZX Spectrum comes with a mains adapter and all the necessary leads to connect to most cassette recorders and TVs (colour or black-and-white).

Employing Sinclair BASIC (now used in over 500,000 computers worldwide), the ZX Spectrum comes complete with two manuals, and together represent a detailed course in BASIC programming. Whether you're a beginner or a competent programmer, you'll find them both of immense help. Depending on your computer experience, you'll quickly be moving into the colourworld of ZX Spectrum professional-level computing.

There's no need to stop there. The ZX Printer—available now—is fully compatible with the ZX Spectrum. And later this year there will be Microdrive for massive amounts of extra on-line storage, plus an RS232C (network interface board).

Key features of the Sinclair ZX Spectrum

- Full colour—8 colours each for foreground, background and border, plus flashing and brightness-intensity control.
- Sound—BEEP command with variable pitch and duration.
- Massive RAM—16K or 48K.
- Full-size moving-key keyboard—all keys at normal typewriter pitch, with repeat facility on machinery.
- High-resolution—256 dots horizontally x 192 vertically, each individually addressable for true high-resolution graphics.
- ASCII character set—with upper and lower case characters.
- Fast text—complicated user software can generate 40 characters per line or other settings.
- High-speed LOAD & SAVE—16K or 100 seconds via cassette, with VERIFY & MERGE for programs and separate data files.
- Sinclair 100 extended BASIC—incorporating unique 'one-touch' keyboard entry, syntax check, and report code.

tum

The ZX Printer – available now

Designed exclusively for use with the Sinclair ZX range of computers, the printer offers ZX Spectrum owners the full ASCII character set – including lower-case characters and high-resolution graphics.

A special feature is DCPM which prints out exactly what is on the whole TV screen without the need for further instructions. Printing speed is 50 characters per second, with 30 characters per line and 9 lines per vertical inch.

The ZX Printer connects to the rear of your ZX Spectrum. A roll of paper (600mm long and 40mm wide) is supplied, along with full instructions. Further supplies of paper are available in packs of five rolls.

The ZX Microdrive – coming soon

The new Microdrive, designed especially for the ZX Spectrum, are set to change the face of personal computing. Each Microdrive is capable of holding up to 100K bytes using a single inter-changeable microfloppy.

The transfer rate is 15K bytes per second, with average access time of 0.5 seconds. And you'll be able to connect up to 8 ZX Microdrives to your ZX Spectrum.

All the BASIC commands required for the Microdrives are included on the Spectrum.

A remarkable breakthrough at a remarkable price. The Microdrives are available later this year, for around £50.

RS232/network interface board

This interface, available later this year, will enable you to connect your ZX Spectrum to a whole host of printers, terminals and other computers.

The potential is enormous. And the astonishingly low price of only £30 is possible only because the operating systems are already designed in off-the-shelf ROM.

Memory query

Dear ZX Computing,
I have read reports that the 128K Spectrum uses 7K to provide the colour and graphics, leaving only 99K of 'usable' memory. There are some marvellous Adventure programs around for the 128K which need the 128K RAMpack. As a layman about to buy his first computer, am I right in thinking that these — when translated into Spectrum BASIC, will not fit into what is left of its standard memory and that I would therefore need the 42K version to take them?

appreciate the 42K would give me much more scope on more involved software is developed than the 128K version initially.

The 42K is 128K RAMpack has dropped £20 so chips have become cheaper. Is it likely that if I bought a 128K Spectrum, the 128K can go up grade to 42K might be released in the future?

I have already seen one of the 64K RAMpacks to make on the back to give a 42K. It bought such a nice little addition, do I just plug it in and carry on? I have read articles (which I prefer not to write) which say the machine does not know how much memory it has got at its

standard and starts throwing in phrases like FREE, FREE and always FREE!

Please answer in both ENGLISH and not English BASIC!

Richard Curran
Faulk, Surrey

★Memory! Do not, repeat not, connect anything except the ZX printer to the back of the Spectrum. Apart from products specifically produced for the Spectrum! This will damage both the computer and the add-on memory if you plug memory designed for the 42K into the Spectrum. Many programs which are marked "128" really should be marked "more than 128" or "how so-called 128 programs actually use all the available memory. However, an ADVENTURE program is likely to use just about all the available memory, so a 128K ADVENTURE program designed for a 128K ZX81 is not likely to fit on a Spectrum. There has been no discussion, apart from the information in the notes about the upgrade from a 128 to a 42K, but it is possible that people find they do lose some of the things they may at a later date than the 42K one.

No speaka da latin

Dear ZX Computing,
I enjoyed your 'Pyg Latin Translator' in the last issue of ZX Computing, and thought you might be interested in seeing the results of my taking up the challenge to write a 'Pyg Latin Translator'. All the translating is done in lines 40 and 45.

The second program is my own Latin translator which produces different results to the one you published in your last issue. Lines 12, 14 and 16 are

the endings of words. Line 40 turns the Latin text, and the subroutines puts U&R or U&S onto the end of a word if it ends in -ING, -ER or -ED.

Y P Whitty
Chelms, Essex

★Thanks very much for the programs. They are certainly a great development from the one we published in issue two. We're always interested in seeing developments of the programs published in ZX Computing.

Bouquets

Dear ZX Computing
Just wrote to congratulate you on the contents of your recent issue. Even the printing had improved apart from the VAT programme in the business section.

Keep up the good work and I'll keep on buying it

Martin Matthews,
Widmore, Cheshire

Improving your tiling

Dear ZX Computing
The program, 'No crony' by K. Skillingham in issue 2 of ZX Computing has a number of faults to my way of thinking.

First, it failed for the distribution of such crony when in fact there is always only one valid destination — the square from which the previous crony was made.

Second, it did not check that each crony was being made from a square adjacent to the empty one. It was easy to cheat.

Third, it always started from the same position or set up a pair of BASIC statements. I am referring here to the Spectrum version of course.

Finally, that initial position was such that it was impossible to achieve the correct alphabetical order by legal moves! The fact that could be achieved was an order in which one pair of letters was interchanged and so most readers will probably be aware, in this type of puzzle, it is only

possible to interchange an even number of pairs of letters.

My version of the program for the Spectrum controls these faults and is prettier as evidenced, and before I detail the changes, I have made.

In the first statement, on line 410, one pair of letters has been interchanged to give a valid starting position. Also the space represented by 32 has been moved to the end of the statement to give a better starting position for the program to work from. This does not affect the validity of the order of the letters.

The RETURN on line 410 has been changed to GOTO 800. As line 500 onward coding has been added to shuffle the start position by performing a random even number of interchanges of pairs of letters randomly selected leaving square 16 empty. This shuffle preserves the validity of the initial state.

Variable n is set to 16 in line 300 and is subsequently used for the destination of the requested move in lines 100 and 110 and updated to the next empty square on line 115.

In line 70 the program tests that the requested move crony is appropriately adjacent to the empty square.

Some cosmetic changes have also been made to the PRINT statements in lines 230 260 but these were just to satisfy personal preferences.

P.G. Houston
Leigh-on-Sea, Essex

More hints 'n' tips to improve your programs

In our last issue, Dilwyn Jones, an experienced ZX programmer from North Wales shared a number of useful techniques for working with the ZX81. This article proved so popular, we've asked Dilwyn to pass on a few more ideas.

Suppose you wanted a character array to hold the names of the months. There are twelve months in one year and the name of the longest month is SEPTEMBER, with an overall size of nine letters. On your computer you would say

```
10 DIM A(12)B
```

To give you an array of twelve words each with ten letters long, `READ DATA` would be very useful to assign the names to the array, but the computer does not have this fixed by 160, so you would probably not go along this:

```
20 FORN = 1 TO 12
30 INPUT A(N)
40 NEXT N
```

and the variables could be saved on tape along with the program since you've entered all the data into the array. When you come to use the array you would find that names which were less than nine letters long had been padded out with spaces at the end to make their nine letters long to fit the array. So if you had the line

```
100 PRINT A(6), "IS THE MONTH OF YOUR BIRTHDAY"
you would end up with
MAY IS THE MONTH OF YOUR BIRTHDAY
All these extra spaces are ugly — it might not
```

bother you with a word like `PERCEMANN` where you would get only one extra space, but with the word `MAY` you get six extra (unwanted) spaces, so we need to ensure that any trailing spaces appear after the word are not PRINTED. Here is a routine to do this:

You will need to specify which part of the array is used — which word if you like — and this is represented by an `X` in the following code. Here is the code above:

```
480 INPUT X
500 DOUB=5000
510 PRINT A(6), TO A(1) IS
THE MONTH OF YOUR
BIRTHDAY
520 STOP
5300 FORA = LEN A(6) TO 1
STEP - 1
```

```
540 IF A(6) < A(1) < " " THEN
RETURN
5500 NEXT A
5600 RETURN
RUN the program and enter the names of the months one by one at a time. As an experiment, try entering one month as all spaces (just press SPACEBAR for one letter). You might expect an error to arise if A(6) is compared with
```

only of spaces, but this is all catered for. If this does happen then `A` will be 0 and `A(6) TO A(1)` will be `A(6), 1 TO (0)` which you might expect to give a subscript error. But the computer does not seem to have a special interpretation for this kind of expression and the first figure at a string place is larger than the second, so you will get the empty string, so it seems

you don't have a birthday.

One small note. Look at line 510. It looks as though there's a number missing before `TO`. This means the error is `A(6) 1 TO A(1)` because if you leave out the number before `TO` the computer will assume you mean 1. Don't forget to include the comma before `TO`.

Having `RUN` the program

price you should have all the names of the months in memory. Every time you want to use the program, use GOTO 490 to save having to retype the names of the month's early time.

SUPPRESSING THE ERROR REPORT CODES

When you have a program where the display is very important (e.g. an educational or educational program) there is distracting or even embarrassing things like "system" error lines into numbers at the bottom of the screen. Turn it not, first is a shellful whereby you can prevent the same report code from appearing.

The error report code is determined by the value of address 18384, the first system variable. The trick is to POKE numbers into 18384 that do not cause anything being printed to print spaces which, of course,

cannot be seen. These values can be POKE'd into 18384 for the purpose: 43, 50, 53, 73, 74, 75, 76, 93, 94, 95, 92, 99.

Here is an example —

POKE 18384, 74

You may find that certain numbers do not produce the desired result with certain programs. In this case, choose another number from the list (above) the program that produces RUNTIME if you do not intend

GREAT SYSTEM CRASHES

Careless use of POKE can run programs by overwriting vital parts or even cause a system crash where the computer appears to come up and nothing you do will make it do anything except crash off.

Here are some of the scariest things you can do to your computer if you do like showing it.

A) Overwrite some of the

NEWLINE characters, particularly at the display file — try the following:

10 LET P=POKE 18384 +

200 * POKE 1 65537

POKE P 0

Now try to get a normal display. The screen appears to have gone haywire if you press RETURN after running the program. All a display has the start of the display file is line 10 from the system variable 18384/18387 which has the specific purpose and changes the character found normally at this location to NEWLINE character CHR\$(11) as a space by using POKE. The page machine then gets confused when trying to produce a string.

B) For some novel displays, try POKE'ing all the numbers from 0 to 255 into the system variable 18384 that controls the color code.

C) Load your favorite program, substitute errors to test the frame counter, so you can wait for a while to see the result (the frame counter is a system variable

18436/7 and is used to save by POKE 18436, 0 and POKE 18437 0). It may not work every time, but it usually causes effective

10 The Prg program

POKE 18411, 0

20 INPUT A\$

Where did the program go?

10 This is the classic POKE anything anywhere in random RAM to cause errors to the system effects possible

10 POKE 18384 = INT

POKE 10000 = INT

POKE 10240

20 GOTO 10

You may like to use the printer of you have one to keep a record of the misbehaving code.

10 LET ADDRESS = 18384

+ INT (POKE 10000)

20 LET P = INT (POKE 255)

30 PRINT "ADDRESS = "

ADDRESS

40 PRINT "NUMBER TO

POKE = "

POKE ADDRESS P

50 GOTO 10

To consult the target (error) look to some more serious things.

LENGTH OF PROGRAMS

Here is how the computer's RAM is organized:

- i) system variables: 128 bytes
- ii) program area including system variables: screen etc.
PRINT PEEK 16396 + 256 * PEEK 16397 - 16509
- iii) program variables, system variables and display
PRINT PEEK 16404 + 256 * PEEK 16405 - 16594

INSERTING NON-EDITABLE LINES INTO LISTINGS

- iv) memory left for user: The above will take into account the machine stack. Because the stack pointer cannot be accessed from BASIC:
PRINT PEEK 16396 + 256 * PEEK 16397 - PEEK 16412 - 256 * PEEK 16413 - 81
is as necessary to subtract 81 because that is the length of the statement.

PART OF RAM

HOW TO FIND THE ADDRESS OF THE BOUNDARIES

SYSTEM VARIABLES	← 16396
PROGRAM	← 16509
DISPLAY FILE (SCREEN PICTURE)	← PEEK 16396 + 256 * PEEK 16397
VARIABLES	← PEEK 16409 + 256 * PEEK 16401
BYTE WITH CHR\$ 128	← PEEK 16404 + 256 * PEEK 16405
WORK SPACE	← PEEK 16410 + 256 * PEEK 16411
CALCULATOR STACK	← PEEK 16412 + 256 * PEEK 16413
SPACE MEMORY	← STACK POINTER - NOT ACCESSIBLE FROM BASIC
MACHINE STACK	← PEEK 16396 + 256 * PEEK 16397
GOSUB STACK	← PEEK 16396 + 256 * 16398

Normally, if you had a fatal author POKE statement in a listing, it is fairly simple to delete them, eg:

```
1 REM IC-FREQ BLOCOS 1500
10
```

(rest of program)

It is a simple matter to delete these lines using the EDIT facility or by typing in the line number. One method we can use is to change the line number of the first post-game line to 0. We know that the first line of a program starts at 10000, so move the line number around as the first two copies of a line, we can use POKE to change these two bytes. Remember the two bytes are stored in the order MORE SIGNIFICANT BYTE followed by the LESS SIGNIFICANT BYTE (ie as you would write 2 = highest part, first then the lowest part).

Here is how to change the line number to 0:

```
POKE 10000:0
POKE 10010:0
```

Now try to delete the first line. Quite simple, isn't it? The only way it is to POKE is not zero line number into 00000:0. So any body with knowledge of the bytes that could easily delete the line.

A slightly better method is to change a line number in the middle

of a listing. This is more difficult because we have no way of knowing where individual lines start. A starting point is the knowledge that postgame lines end with a NEWLINE character (CHR\$(13)) and the next line will begin with the line number. Take this example:

```
10 REM VAT CALCULATOR
20 PRINT "ENTER AMOUNT"
30 INPUT A
40 REM IC-FREQ BLOCOS
1000
50 PRINT A
60 PRINT "VAT="; A*15;
100
```

We need to change line 40 to line 0 and keep it located in its present position in the listing (ie we might fault to delete or edit). Using the information we have, add these lines to the program:

```
0000 REM VAT - 15000 TO PEAK
10000:0
```

```
40 REM VAT CALCULATOR
50 IF PEAK > 115 AND
255*PEAK
P<= 11+PEAK P<= 25-40 THEN
50 TO 0:0
40
6000 NEXT P
6000 STOP
```

```
5040 POKE P+1:0
5060 POKE P+3:0
Now delete lines 5000 to 5040
and then try to delete line 0!
```

Incidentally, it is normally better to delete the first line 0 at a point higher in a listing than line 255, since it will then be necessary to change 2 bytes of the listing (adding offset 0 just to make a bit safer). Another way to do the same thing is to use the system variable HOSTLN (100420/104420) to find the address of the start of the next line, provided you have space to add a few extra lines to the listing. We'll see this example:

```
10 REM PATHFINDER
20 INPUT A
30 PRINT A
40 REM IC-FREQ BLOCOS
1000
50 GOTO 30
```

Add these extra lines to the program:

```
30 LET A=PEEK 10435+
255*PEAK
5430
41 POKE A:0
42 POKE A+1:0
43 STOP
```

Now use RUN 30 to make the machine work. Once line 40 has been changed to line 0, delete the extra line. Incidentally, if you like making loads of computers, you can have your fun POKEing all sorts of line numbers into memory. Whenever the computer starts lines into order automatically!

PREVENTING A SCREEN MEMORY OVERFLOW

This routine makes use of the system variable (04442) which refers to the line number of the PRINT position, but does not have the same value as the first number. System off at 24 for the top line of the screen down to 1 for the bottom line. The expression IF PEEK 10442 = 4 THEN CLS do if the PRINT position moves onto line 21 (the lowest line the user can PRINT) and the screen is cleared automatically.

Some programs require that the screen be cleared automatically to prevent a screen memory overflow when the PRINT position gets close to the bottom of the screen. Here is one way to do this:

$R = \text{RISC } 10000 \div 4 \text{ THEN } C10$
 10442 is the current variable containing the line number of the PRINT position. It starts off at 24 for the top line, down to 3 for the bottom line available to the programmer, and 2 and 1 for the two lines at the bottom of the screen used for INPUT etc. If you used 4, but you could substitute another number if you like.

Naturally you can only PRINT on the top 22 lines of the screen display (lines 0 to 21). Any attempt to use the bottom lines with PRINT is naturally inhibited by error report 5. You can in essence fix these lines by two methods. The simplest is to POKE device into memory at the location of the bottom hardware of the screen.

If you have more than 2K of memory plugged in (as if you have a 16K RAMPACK) so that if the display is at full size, then line 23 starts at $\text{POKE } 10396 + 256 + \text{POK } 10397 + 256$ and at $\text{POK } 10396 + 256 + \text{POK } 10397 + 256$ line 23 consequently starts at $\text{POK } 10396 + 256 + \text{POK } 10397 + 256$ and ends at $\text{POK } 10396 + 256 + \text{POK } 10397 + 256$. These addresses will be different if the display file size is zero, as might happen if SCROLL was used. The second method uses PRINT AT and the system variable DF - 52 at address 10416. The number in 10416 says how many lines in the bottom of the screen are not available to the user - namely four. So if we change the number to 0, we have access to all 24 lines of the screen display and we can use PRINT AT 23, X or PRINT AT 22, X.

However, this method causes a problem when the computer tries to use the bottom of the screen for help reports, INPUTs or even SCROLL. You can get a very nasty system crash

and then your program if you re-display the listing (storage is lost, done, but you may have to switch off for a few minutes). The statement `POKE 10418 0` must be entered as it is in a program.

It does not work if entered as a direct command without a line number because the computer will insist it automatically when the screen is cleared in a program is `POKE 10418 0` during the course of a program then you should `POKE 10418 0`

to restore the bottom of the screen to normal before attempting to use `INPUT`, which will of course cause characters `PRINT` on line 23 and 24 to be lost. Be careful if you're using an unmodified machine — the display file behaves as it always, and means use of `10418=0` is not to upset it too much.

To place any particular line number you require at the top of automatic listings, you must first move the cursor to a line number

greater than the one you want at the top. Then enter:
`POKE 10418 NUMBER + 87`
`POKE 10418 0`
`POKE 10420 INT(NUMBER/255)`

Now when you press `NEWLINE` the automatic listing will begin where you specified `NUMBER` if is the line you want at the top of the screen. When entering lines when the cursor is at the bottom of the screen, the computer will usually complete the listing 2 or 3

lines to get the raw line onto the screen listing at the bottom. This is annoying, but is no reason for concern. You can also use the line 23. Try in any line number higher than any shown on screen and which does not exist in the listing (e.g. line 255555).

The listing will change if you now continue entering lines where you want originally. They appear near the top of the screen and the listing is made properly, saving a lot of frustration.

SPECTRUM Software**

ZX KEYBOARD

The only to keep all the keys in the correct position and to keep the keys in the correct position.

**SPECTRUM
MEMORY
UPGRADE
TO 128K
£39.95**

Fully cased with numeric pad £45
Uncased with numeric pad £30
Case £19

NEW FROM dk'tronics

- (A) 128K Ram Module - 128K 128 Memory
Fully cased and boxed £14.95
- (B) 128K Memory Expansion £49.95

Foxing about

In **FOX AND CHICKEN**, written by Jim McCartney of Coleraine, you take part in a high speed chase through a maze. Playing the program calls on all your reflexes and luck — and demands an ability to keep cool in a crisis.

The object of this game is to get the chicken out of the maze without having it eaten by the fox. The program contains full instructions (pages 100-101).

The program is a mixture of BASIC and machine code which would not suit any other machine. Most of the actual running of the game is in machine code; the BASIC is used to set it up and to draw the maze, etc. The BASIC is well enough illustrated for a reasonably competent programmer to find his/her way around it, but because the machine code can be tricky when you peruse the lines of lines 76 and 77, I have given full assembly code details together with a description of the operations in code. (Because bugs can creep in during the process of transferring listings, here my typewritten (unformatted) details checked to your ZX81, then lines 76 and 77 compile against both the BASIC listing and the machine code listing. If in doubt, check the machine code listing against the assembler source in the left column, using Appendix A in the ZX81 handbook. (You will not find the assembler codes for CALL \$30A4 or CALL \$30C9F; these refer to subroutines in the ROM.) When you have done all this and everything agrees, SAVE the program before you RUN it! It crashes, try checking the code again.

FIGURE 10

```

155 JPN0 "GET HERRING FOR ME!"
157 INPUT J1
52 CLS
165 PRINT "THE CHICKEN CAN FLY ONLY A FEW TIMES
IN EACH RUN. YOU CAN MAKE IT FLY BY HITTING
P."
183 PRINT
175 PRINT "YOU GET TEN RUNS IN EACH MAZE AND
THEN A NEW MAZE IS DRAWN. ALL THE MAZES ARE
DIFFERENT."
173 PRINT

```

Comments

```

1      Load Z10 characters after ROM is put the machine
      code in
55      or use PAUSE
30      A very short delay
21      Put the game in machine code
40      P C=40 the fox into the chicken
80      R C=80 the chicken escapes
60      H C=60 the chicken flies
65      JF is a flag used to RETURN to SUB 1700
67      JPN0 counts the number of times the chicken flies
68      POK0 displays "P" key
70      It is used to copy the ROM without bugs. you can
      release lines 70 to 80 before you pass the final version
      The machine code will now be safe in the ROM
      statement in line 1. You can see this if you LIST

```

Once you have got all the ROM without bugs, you can release lines 70 to 80 before you pass the final version. The machine code will now be safe in the ROM statement in line 1. You can see this if you LIST.

```

85      Loads the machine code in A0 into the ROM statement
80      Sets up entry 2 is used to draw the maze
55      T is used to draw the maze
57      M is the total of maze made in the order drawn
180      Amend these instructions and the corresponding lines
      below to suit yourself
230      S must be a line which says GOTO 31. The further
      down the listing it is, the closer will be the game
1208      To watch the maze being drawn, put in 1208 B,000
1212      31 means escape
1320      Set up a random starting point for the maze
1310      Explore the four directions possible from the current
      node of the maze
1250      If it is possible to move in more than one direction in
      drawing the next node of the maze, a random positive
      direction is selected and drawn
1380      If only one new direction is available, this is chosen. If
      no new direction, then backspace
1400      Go back through the maze as drawn, using the M array
      until a node is found where a new direction can be
      drawn. If no such node is found, (M=0), then maze is
      complete

```

```

1510      Find an open space on the left side of the maze, and
      put the chicken in it
1510      Find an open space on the right side of the maze, and
      put the fox in it
1620      Draw an open space leading out of the maze (across the
      fox, and a door outside)
1650      Put the fox pointer in the machine code variable
1680      Select a direction for the fox to turn
1684      Change the machine code reference entry accordingly
1700      Put the chicken pointer in the machine code variable
1800      Reset flag
2002      or PAUSE
2010      Clear the fox and chicken positions
2020      Put them back at the starting positions

```

2043	Repeat the top line of the maze	13	OP13 JBC 134	01 17 26 7C	n 23. Have it a stream; goto CATCH
2050	Add the score	13	POP BC INC BC JL - 32	C1 03 14 5A	R, R! get the old reference back increment it and repeat from 13 till successful
2057	Reset the life counter	14	LDHL, B PUSH HL	3F 09 06	Push B to the new life position and stack the position
2060	Increment the run counter	15	ADD A, B INC HL, BC LDL B LDI 34 ADD HL, BC LDHL D	C8 00 10 4C 58 0 02 31 05 26 00	Change HL back to the old life address (F4 - 32) add 32 to get the new address and push 0 to it
2066	If 10 runs completed, break	16	POP HL ADD A, C INC HL, BC LDI 155154 HL	01 09 00 10 4C 23 02 40	Get the new life address back, subtract 32 to get the new "F4 - 32" and put it in 155154 for the next time round
2100	Start again	17	POP BC LDI 155141 A	C1 0A 23 02 40	Put the contents of the reference address into 15514 to give the new "C" last 1

Adding a keyboard to the Spectrum

Stephen Adams looks at the electronics beneath the ZX keyboards, and tells you how to add an extension keyboard of your own.

The three ZX computers produced by Sinclair — the ZX80 ZX81 and the ZX Spectrum — all use the same type of keyboard. The method of getting information into the three machines is also the same, so I will only go over the Spectrum Keyboard pointing out the differences between the various machines.

The keyboard itself is made up of three layers of plastic. The top layer is coated on the inside with metal strips in a grid pattern which go horizontally under five keys. Each set of five keys has a different metal strip running under it. For example, keys 1-5 have one metal strip running under all the keys. The bottom plastic sheet has a grid of vertical metal lines running under four keys.

This metal grid runs under two sets of keys one on each side of the keyboard. Keys 1-5 & 6-9 are connected to the same strip as M-F-B. The middle sheet only contains a set of forty holes, one under each key, so that when a key is pressed the upper metal strip can touch the lower metal strip. This forms an electrical contact which, when the two grids, which were all topped, are connected to which wire of the bottom grid is determined by the key pressed.

By putting voltage on each of the eight top wires in the metal grid and by feeling each one of the wires on the bottom grid we can tell which key has been pressed. Every key has a unique combination of one top grid wire touching first and one bottom grid wire being first.

The main difference between the ZX80/81 and the Spectrum is that the keys on the Spectrum have been covered with a flexible rubber sheet

which has key tops insulated on to it.

The sheet is suspended over the keys so that it flexes when a key top is pushed down giving a much needed feel to the keys which the ZX80/81 did not have.

Such is the importance of feeling that on the keyboard of a ZX computer (which can increase the speed at which information can be typed in by up to 50%) that many people have fitted an extra keyboard to replace the one that Sinclair provides.

This extra keyboard is usually made up of forty keys which are laid out in the same pattern as Sinclair's keyboard. In many versions, wires which are joined together only when the key has been pressed down, so they did not like the keys on the Sinclair keyboard.

The difference is that these keys can be pushed down up to half an inch and can therefore be felt moving under the fingers. This movement or 'feel' allows you to release the key as soon as it has reached the bottom of the

key's movement and go on to the next key without having to check whether the key was registered on the computer. It will only do this however, as the ZX80/81 as the downwards movement was only 0.1 inch and consequently many people kept their fingers longer on the keys than necessary.

With the ZX Spectrum this has improved, but I think that many people would still like a proper moving keyboard for two reasons. One is so that the keys

THE ZX KEYBOARD

REMOVABLE PLASTIC TOP

FULL MOVEMENT
OF SWITCH

WIRING TAGS

A TYPICAL KEY SWITCH

FIGURE 2

SINCLAIR SWITCH

FIGURE 3

can be left, but not every key press is registered on the computer. The second is that the ZX Spectrum now has two SHIFT keys called Symbol Shift (which is the second key in from the right hand side on the bottom row) and Caps Shift key (on the far left hand side of the bottom row). With Sinclair's keyboard either keys act in complete pass, either separately or together and this makes it very awkward to use as the user is constantly crossing his or her hands switching from one shift key to another. The mess of the Symbol Shift key next to the Caps Shift key on a new keyboard would make it a lot easier to use as both keys could be pressed with one hand while the other attended for the appropriate key.

Constructing a keyboard

There are four ways of constructing a ZX keyboard —

1. Build it up from a kit purchased from a computer manufacturer.
2. Obtain an old computer keyboard and strip every bit of coating (usually a printed circuit board) so that the keys can be removed like Sinclair's.

3. Make up a printed circuit board and purchase some keyswitches for it, the printed circuit board taking the keys in-line.
4. Make up a case from metal sheet and mount the keys on it. All that is required then is to wire it up from key to key using the same matrix as the Sinclair Keyboard.

Assuming you want to do 2 or 4 is wiring it right is required (such as shown in Fig. 1). The keys are wired up like a three dimensional grid. Dividing the keyboard into eight lines.

Each bit will have a wire attached to it which will go to a particular address line on the computer's keyboard module. It is important that those lines are wired up correctly as although it will cause no damage to the computer if wrongly connected, it will not give the correct or in some cases any response. The completed, the data wires can be wired in to the other side of the switch. All the switches should be of the push to make single pole type and should only have two tags. The data wires run vertically up the keyboard and it is better if the data starts from the end of the keyboard and working inwards.

Each data line should clearly

five is taken to two lines of keys, the subsequent keys are connected together (Caps Shift A-Q, 1-0 P-ENTER-SPACE).

ZX80 and ZX81 users will have SHIFT instead of CAPS SHIFT and NEWLINE instead of ENTER on their keyboards. The next column line of keys on the far right hand side is connected to the rest of the keys on the left hand side. This ends up with the two middle vertical wires being joined together.

On the ZX Spectrum, the symbol shift key can either be moved to the position shown in Fig. 1 or an extra key provided there. Both should be wired as shown.

The best keys to use are those with clear plastic tops as the labels for the characters put underneath them. If you haven't

got any closer, then paint out the tops of the keys with white paint and using various coloured inks, write the functions on the keys. Spectrum users will have quite a lot to do as there can be up to 8 functions to each key.

Connecting it up to the computer.

To make it easy to identify the connections of the 13 wires used on each computer, I have labelled them A-M for the address wires and D-L for the data wires. See Fig. 4 for the connections to your computer.

All the connections should be made to the underside of the keyboard sockets or in the case of the ZX80 directly to the printed circuit board as this allows you to use the original keyboard as well.

COBRA 1000

THE COMPLETE BUSINESS SYSTEM FOR THE ZX81

The Cobra computer system allows you to expand your Sinclair ZX81 into a powerful and efficient computer for the small business.

- Accommodates a full range of business hardware
- Capacity for up to 9-12 boards
- PCB slide guide systems ensure total stability
- All add-on hardware comes complete with leads and sockets — no soldering of drilling necessary
- Durable lightweight metal computer case
- Fully professional keyboard — with space bar

HIGH QUALITY, FULLY BUILT BASIC MODEL £79.95 + VAT

Expand your Cobra with a comprehensive choice of add-ons.

- Interfaces • Tape drive unit • Upper and lower case character board • High resolution graphics • Input/output ports • Light pen • Colour Modulator

THE CHEAPEST INTERFACES ON THE MARKET

RS 232 Interface

At last a high quality 232C interface to allow you to connect your ZX81 to any 232C printer from the cheapest dot matrix to the most expensive daisy wheel. Look at these features...

- Baud rate variable from 110 to 5600 with software control
- Upper and lower case printout
- Up to 120 characters per line
- Small and compact — fits on to the back of your ZX like a RAM pack
- Uses the ZX power supply
- Output via a small 3 pin jack

Price only £26 + VAT

Celetronics Interface

Allows you to connect the ZX to any Celetronics printer. Has similar features to the 232C interface — one exception is that output is via a 24 way socket at the back of the unit.

Price only £26 + VAT

Caring Soon: ZX81 SPECTRUM MICRODRIVE INTERFACE

Connect the Sinclair to the new Spectrum Microdrive! As soon as the microdrive is available we will be developing an interface for it to be connected to your ZX.

Interfaces will also be available to adapt the example of modern micro engineering for use with Apple and Pet computers.

This is just one of the future developments by Cobra Technology.

MICROLINE A PRINTER

- Print speed 120 characters per second • Bidirectional printing • 5 x 7 dot matrix • 5-10 and 6-5 characters per inch • 8 or 10 lines per inch • Vertical tabulation and form feed • Form length user selectable • Upper and lower case • Block graphics • 1 line print buffer • 80 characters per line

Price £281.75 inclusive of VAT

Microprocessors and bus systems

We look at the most commonly used microprocessors, and delve into the mysteries of the S-100 bus.

The most commonly used microprocessor chips in the field (by market) are the 8080, Z-80, 2860, 8086 and 8088. Other variants can be easily spotted — the 8088 is very similar to the 8080 but with certain changes. The 286 machines are built around the Z-80A chip, a development of the Z-80.

Which is the best one? This is a difficult question — it's like high level languages: tell which there are really different types and opinions; people who are used to a particular one will prefer it to any other.

Long arguments develop between programmers over the good and bad points of each language. It's the same way with processors.

The 8080 is probably the processor with the most 'soft-ware support' — it has the most programs written for it. The Z-80 can run any program written for the 8080, as well as some which the 8080 cannot.

The 8086 has the advantage that it needs practically no 'support chips' — it will more or less stand alone and is thus ideal for many dedicated applications, such as copiers, alarms, etc.

The major differences between the processors in terms of programming are the instruction sets and the number of registers.

The instruction set of a processor is a list of all the different arithmetic and logical operations it can perform — like the number of steps in a calculator. The registers in the processors are the same as calculator memories — the memory buffer.

The 8080 instruction set is about the same level of complexity as the 2860 and the 8088. This is adequate for most

applications.

The 8086 has a rather limited instruction set and relies on its state of application for its power.

The Z-80 instruction set includes the 8080 set — and then some! It also has twice the throughput: it is usually felt that the 8080 level of complexity is sufficient for the beginner.

S-100 and all that

What exactly is the S-100 bus? On any bus for this matter! No, there's something to do with data transport. The word 'bus' is short for 'common' (usually 'for all'). Basically, it's a method of interconnecting parts of a computer system so that they can communicate with each other.

It takes the form of a 'backplane' or 'mother board' which holds several edge con-

nectors. Printed circuit boards can be plugged into these, one edge of the board being covered in gold-plated strips (fig 1) up to its edge. Contacts on the edge connector make electrical contact with these strips. The S-100 bus system uses double-sided boards with 50 strips per side (plus the 100 in S-100B).

Each board — one of which will be the microprocessor board, having the micro chip itself plus all the other 'support' chips necessary to get the thing to work, such as oscillators and buffers etc. — has some outputs and some inputs which are connected to the bus in a standard configuration. There are sixteen lines of the bus which carry information addresses. These have a position in memory is defined — by a certain digital number.

When the microprocessor wants to find out what's at a

particular address on the board which carries the memory, it puts that address on the sixteen address lines, just as it requests some of the other lines of the bus and the memory board looks up the required information and puts it onto the data section of the bus. The microprocessor board then reads the data from the bus.

Other buses have differing numbers of lines and the positions of the data and address lines are also different, but they work in essentially the same manner. Unfortunately it is difficult to adapt a board intended for one bus system to a board intended for another.

For this reason, each manufacturer either uses his own bus structure, as is the case with Simulink, or uses the S-100, which is about as close to a standard as the hobby computer field has.

Fig. 1. Standard S100 cards are 18" by a nominal 5.3". Some manufacturers change the height depending on circuit requirements. Edge connector spacing is 0.125", offset to prevent backward insertion of a board.

Ready, steady, go!

In the first issue of ZX Computing, Henry Budgett and Tim Hartnell discussed the standard benchmark tests used to test the speed of various functions on microcomputers. Stephen Tyler and Mark Dulling of Kingsbridge in Devon decided to get out their stopwatches, and put a number of popular computers through their paces, to see how they measured up.

We were interested in the benchmark tests for testing the ZX81's speed in the Summer issue of ZX Computing, and

have run the following tests, including 32-bit four even additions on different types of computers.

We did all timings in minutes and seconds, to two decimal places, and used the maximum abbreviation possible on the

micro being used (such as M for NEXT on the Atom and the BBC Model

Hardware

The computers we used

Some ZX81 belonging to S. Tyler
Commodore PET belonging to J. Meyer
BBC Microcomputer all belonging to S. Tyler
Acorn Atom belonging to S. Tyler
Research Machines 4802 Upper School

The results for benchmark 1
SLOW FAST
ZX81 17.78 8.58
Floating Integer
PET 1.64
BBC 0.48 0.18
ATOM 0.48 (approx.)
4802 1.1 (approx.)

Benchmark 1 was timed on the computers but the time with lines 1 to 8 on setting of

PET 1 20480 18001 20480 7000

The speed of the ZX81 dropping to 30.58 in SLOW mode and 31 in FAST mode. The other computers were unaffected.

The results for the benchmarks are given below.

	1	2	3	4	5	6	7	8
ZX81 SLOW	17.78	27.04	1.05.13	1.02.57	1.13.51	2.18.05	4.38.45	1.31.75
FAST	8.58	8.64	18.32	15.78	18.43	48.78	1.08.72	22.05
BBC Floating Point	0.48	3.74	7.77	8.23	8.63	12.07	18.05	4.58
Integer	0.15	1.80	7.28	7.43	7.71	8.83	13.71	4.84
PET Floating Point	1.64	8.80	18.00	20.00	21.60	32.00	50.00	9.82

The following 32 tests consist of a loop from 1 to 1000 with a different function inserted in the loop for each test. The

ZX81 functions in a program like those shown were left as they are. Equivalents have been used in other computers. The

times given are the times taken for the loop with the function with the time for the open loop subtracted to give the time of

the function. 1000 times. They are averaged in the order of the fastest to the slowest in terms of the ZX81.

The ZX81 in FAST mode was considerably faster than the PET but is only faster than the BBC microcomputer at clearing the screen when it has less than

32K of RAM according to the system variable RAMTOP when the display file is not full. The table (right) shows the average relative speeds of the

computers with the BBC microcomputer using integers given a value of 1 and the test given higher values because of their slower speeds.

BBC Integer	1
BBC Floating Pt.	1.72
PET Floating Pt.	3.35
ZX81 (FAST)	4.03
ZX81 (SLOW)	18.20

COMPETITION

WIN A ZX PRINTER

**Win a ZX printer, and a
complete set of
Psion/ZX81 software!**

We're looking for its other programmers — and we've got great prizes to give the winners: a ZX printer for first prize, and five sets of Psion software for the ZX81 for the runners-up.

All you have to do is write a clever program — in BASIC, which fits within 1K, on the ZX81, and has something to do with money. It doesn't matter if your program has demons in it, or is devoted to discussing the

Southern Region, or helps lost and weary travellers find their way to the Cornish Lure at the Underground, or whatever. But the program must be in some way, with money.

Your entry must be a clear typing (gender doesn't matter) on computer-acceptable to send you one, or splendidly hand-written. No computer programs. This competition is not open to permanent contributors to the

magazine, or any other of the computing periodicals. We'll be printing the best entries in the next issue of ZX Computing, where we'll also be announcing the lucky winners. The entered program must not have been previously published, must be your own original work, and must not have been submitted for publication to any periodical. Entry to the competition will be continued as permission to publish the program. No prizes can be returned.

The winner has to write the last mail on October 11, 1982. No correspondence regarding the competition will be entered into, and — as they say in the Classics — the judges' decision will be final.

Send your entry to: ZX Printer Competition, ZX Computing, Arjan Computers, Puffin House, 145 Charing Cross Road, London WC2.

FROM AFDEC ZX81 IMPROVERS ZX-PANDA

16K-byte EXPANDABLE RAM for ZX81

- 16384 bytes of static random access memory (16K)
- Expandable to 32K with easily fitted internal plug-in module
- Simply plugs into rear expansion port of the ZX81 computer
- No additional power supply required
- LED power indicator
- Attractive black custom made case contoured for stability
- Compact size (70 x 31 x 26mm approx)
- Compatible with most expansion systems
- Full 1 year parts & labour guarantee
- Exceptionally low fully inclusive prices:
ZX Panda 16K Expandable Ram Pack **£25.00**
ZX Panda 16K Expansion Ram Module **£10.00**

OR The two together — Giant Panda 32K Ram Pack **£35.00**

- Prices include VAT and Delivery
- Delivery from Stock
- The only available 16K Ram Pack that is directly expandable to 32K using a plug-in module that fits neatly inside the original Ram Pack case

KEYBOARD NOW READY

A professional quality keyboard for your ZX81. Only **£25.00** built, tested, cases including VAT and Delivery

- Easily fitted
- Recent typing
- High quality engraved keys
- Fully tested case and guaranteed
- Long life keys with 10° operation
- Case to fit

Noisy little things

ZON X-81 sound unit

In this case, our hardware reviewers look at a system which allows you Z801 to listen to Z801 sound maker or drive and a device to ensure that you don't lose a program when the power fails.

ZON Sound Unit

A wide range of sound effects can be added to your Z801 with the ZON X-81 Sound Unit now available from BI-PAK.

The unit is based on a three-channel plus noise mixed chip, and is so designed that the 811 chip and volumes of the three channels and the control of the 811 chip can be used to create a wide range of sound effects.

controlled by simple BASIC statements. By this means, bells, telephones, leaves and explosions can be simulated and easily added to existing programs.

ZON X-81 is completely self-contained, it operates at 5V and has a volume control (in addition to programmed volume) and simply plugs in between the rear of the Z801 and its 811 pin socket (pin 1 of the 811). No demanding, wiring, soldering, batteries, power supplies or tools are required.

Instructions will show you through the operation of the unit step by step and include a

number of example programs of useful sound. It is available from BI-PAK Semiconductors, P.O. Box 6, Ware, Herts SG4 6JZ, UK. Price £25.00 (including postage and V.A.T.).

Rig Ear

The 'Rig Ear' speech recognition system, which costs £48, plus V.A.T., including plug, consists of a microphone, pre-amplifier, analogue frequency filter and digital processor. Words are stored as voice patterns which the system learns from repetition by the user.

Ten or so words can be

stored at a time.

The computer then checks each word spoken against its word bank and assigns a percentage to each word regarding its chance of being the word spoken. It assumes the word giving the highest score is the spoken word, and responds accordingly.

It is available from William Stuart Systems, Green House, Herts, SG4 6JZ, UK. Price £48.00 (including postage and V.A.T.).

Protecting that program

The 'software protection unit', made by Microbyte of Litchfield,

looks like beings partial answers to all those howling moments when BK wants to carefully typed in programs suddenly vanishes.

The software protection unit has a socket to take the main power unit jack plug from your ZX81 mains transformer, and the plug on the unit then hooks into the ZX81.

If you uncover the four screws on the lid of the unit, you'll see two battery compartments, which hold a total of six batteries. These are the secret of the unit, which is designed to take over if the power fails.

When we tried it, we found it worked exactly as advertised. We didn't find it how long will a program last, but we take the manufacturer's word that

with a ZX81 alone, a program will stay intact for three hours and with the 18K attached, about an hour and a half.

You're cautioned to always remove the power jack plug on the ZX81 after turning off the mains supply, or the batteries will leak. There has been a power supply and waste battery problem keeping the 81 going. The batteries are of course, only intended for emergency use. Especially if used batteries are signalled by video character deformation, and loss of sync, although at this stage the RAM contents are not lost.

The unit costs £35.00 and is available from Microbyte, 19 Worcester Close, Lichfield Staffs. CV44 3J1 02000.

The Microbyte Software Protection Unit

Making Music

If you want to add sound to your ZX81 the Boston Electronics Music Chip can be of interest to you.

There's a DAY 31881 Digital gateway chip interfaced to the ZX81. This chip is equipped with a peripheral circuit board with all the necessary interfacing components.

The chip is plugged in to the rear of the computer.

The computer's edge connector is reproduced behind the p.s. to handle RAM packs and protect the circuit.

The music chip is a fairly busy little device. It provides three separate audio channels and each of these can be programmed with separate frequencies and volumes.

A programmable tone generator can also be switched on to the three channels and a programmable envelope generator can be set up to control the volume of the three channels, as you can see there's a fair degree of flexibility built in to this particular package.

It also includes an on-board audio amplifier which has enough output for a small loudspeaker. Unless you don't get with the bit.

The amplifier input and output connections are brought to the output connector so that any of all of the audio channels can be amplified by the on-board amplifier or they can be fed by an external amplifier.

Because you have the three

The Boston Electronics' Music Chip is programmed to sound like a p.s. and it's shown here with a small speaker connected to the ZX81.

The computer's edge connector is reproduced at the back of the p.s.

separate channels you could, if you felt particularly enterprising, use the output for stereo. As channel 1 came out of the left speaker, channel 2 came out of the right and channel 3 was mixed equally between the

right and left speakers.

The unit also provides two d-type ports which can be controlled by the computer. They could, for instance, read an external keyboard or produce. Each chip is fairly easy to pro-

gram by PEEK and POKE. Full instructions are provided.

The chip is available for £18.00, including p and p from Boston Electronics, 44 Ryeland Drive, Bolton BL5 1GP. Lincs. (Bolton) 647721.

Get a load of this

Pulsar Products, a hi-fi peddler to the ZX81, Kayote and Scepter, have developed a new product: the ZX Loading Aid. It is designed so that you can set the cassette player volume control at just the right setting so that the signal the computer receives is neither too weak nor too strong. It is designed to ensure that even tapes made on foreign cassette players will load first time.

The Loading Aid is basically a circuit designed by Charlie Newbould, which detects and shows the signal level on two LEDs, enabling you to distinguish between quiet passages, voice introductions, the introductory buzz and the main body of the program. You can also actually see drop-outs on the tape.

The Loading Aid is a small black metal box which houses the circuit, two sockets at the rear for the ZX81 and two jack plugs. As well as this, there is a red and a green light emitting diode. You simply fit the Loading Aid between your cassette recorder plus power supply and the ZX81. When the tape is playing, you adjust the volume control so that the intensity of the green LED matches that of the red one. The cassette player is then at the optimum setting for that particular record program. The ZX81 Loading Aid is £9.95 including postage and VAT, and is also available for the ZX80 or Spectrum. Specify which computer you have — Pulsar Products, 'Islands', Group Lane, Frinton, Worthing, West Sussex BN14 4UP 0203 67102780.

Pulsar Products have also introduced a new improved version of their Scepter. When any of the reset or shifted keys is pressed, the unit generates a 'burst' signal. That is all it does, therefore you can blow the unit in £6.95 which is cheaper than a VLT.

The module is made up of a printed circuit board which fits into the ZX81, so there are no trailing wires outside the case. Both ZX81 keyboard take comp-

ly plug into the module. Pulsar provide two flexible ribbon cables to complete the connection back to the ZX81 only.

Features of this unit include the fact that no soldering is required; the model is small

enough to fit under the keyboard; you can get an optional on/off switch for £3 extra; and the Scepter can also be used in conjunction with many of the full size keyboards presently on the market for the ZX81.

William Brown (upper right) is an extensive ZX81 user. He is using a Spectrum system.

The Yellow ZX of Eighty

As you can see, the music information is held within the string, A#, in line 50 which is checked against by command. Lines 100 and 310 wrap the string down, character by character.

Note that there must be a space callen after the word PRINT in line 110. Lines 120 to 140 are just CLS.

Line 150 terminates, and lists the program after you've finished.

You can easily adapt the program to play other splendid melodies, by changing the contents of A#. We'd be very interested to see any other examples of music you can create.

From Vaxjo, in Sweden, Lars Johansson, sent us this great program to play 'The Yellow Rose of Texas' on a ZX80.

The program will help you find your way through a long JCRS program. To start it, you just type in **RLN 9990**. The JCRS will check for the wrong it is to search for.

You type in the string to match (which can include start tags) in `find`, which you must prefix with a `#` sign.

Here's an example. If you wanted to find **FOOD** **PIZZA** (**5**), you'd just enter **FOOD(5)**. The program will then list the first appearance of the search string. It continues the search to find the next appearance of the string where **FOOD** **G** then a space the **5** is under and then **NEWLINE**. When you reach a **NOT FOUND** **FOOD** **G** will over the first match at the top third line.

© 2004 Blackwell Publishing Ltd *Journal of Internal Medicine* 255: 103–110

As a test, you might like to get the program to list all the files in a directory.

Moving with the flow

If you're bogged down with a bug, a flowchart can help. Henry Budgett, editor of 'Computing Today', tells you how to go about it.

People who program generally tend to fall into one of two categories, those who use flowcharts and those who don't. I tend to write mine after the program and then correct the bugs, and I'm sure many of you do too!

The technique of flowcharting is of great benefit to those who like to

track problems logically; they draw text diagrams that list all the possible options and then code up the results. The result of all this is usually a superb program; it never fails and is always fast.

The rest of us write and debug our efforts as we like them; it's bad up with programs that work, fail occasionally and

are usually ready to retire. In this article I hope to put across some of the ideas behind the writing of flowcharts, and demonstrate their useful points.

The Simple Idea

A flowchart is defined as "A diagrammatic representation of

a series of events, usually in drawing the analysis or solution of a problem". This is simple to say, but not quite the same as an Algorithm. This is defined as "A defined process or set of rules for solving a given problem".

One usually starts with an algorithm, produces the flowchart and then codes the program. The simplest form of

Fig. 3 Splitting the problem into smaller tasks.

flowchart is shown in Fig. 1. It uses no special symbols, and is really an extended version of the basic algorithm.

Flowcharts usually contain lots of pretty little boxes which must mean something, and indeed they do. In Fig. 2 I have listed all the common types and three designated functions. This is only a small selection of the available symbols but for most programs it will be quite adequate.

The Standard Use

Having taken a look at the available set of symbols we can now try writing the simple flowchart in suitable form. This is shown in Fig. 3. For the actual task of converting it into a given language this will be quite sufficient, regardless of which language is to be used.

A problem of this complexity doesn't really deserve a flowchart at all, and indeed most professional programmers are quite capable of coding up large programs

from a single set of rules, or even the basic algorithm. In Fig. 4 I have attempted to formalise, rather crudely, problems that all savings banks can be quickly seen it will work but it is by no means bug proof. Never mind, we'll soon throw a little of the usual reply whilst it is quite good enough to write a program from.

We will take a test look at this program flowchart before we move on — it can be rewritten into two parts, a Control section and a single sub-routine section of the task as substantiated with their own flowcharts. One can quickly sort out complex problems and even write and test the various routines on their own before fitting them into the complete program.

The Real World

Computers being what they are, logical the previous attempts at flowcharting bear no relation to a true programmer's flowchart.

A typical example of such a

Fig. 4 A true programmer's flowchart for a simple task.

test can be seen in Fig. 5. The task is to produce a set of arithmetic tables for any given number between 1 and 12. The diagram shows all the steps needed and you should be able to follow it through on your own, there are comments!

The ideal of every programmer is to produce not only the ultimate 'bomb proof' program but also to have it neatly documented. This is the breakpoint between professional programs for a software house or indeed a magazine for publication and hopefully a program.

It is almost obligatory to include not only a flowchart but a complete description of just what it does. In a case such as the you will find that your first flowchart will be so cluttered on that you have to redraw it and it is well worth rewriting a sketch that gives the standard symbols.

It is also essential to keep a duplicate set of all the documentation for security if you happen to need it with the time you have got a handy piece of evidence in case

anyone rips off your version of Pascal and starts selling it and not paying any royalties!

In Conclusion

If you are capable of determining the way you wish to solve any given problem, writing the algorithm, you are capable of producing a flowchart.

They are useful for debugging programs but you will find that they soon become covered with modifications and have to be redrawn.

The most useful function is as a piece of documentation, how often do you remember how a program worked after months and as a means of testing out sections of a program such as subroutines.

Flowcharts are not essential as some people would have you believe but they do bridge the gap between successful programs and those which work.

References

*Some definitions are taken from The Dictionary of Data Processing from Pearson's Builder which is as you can argue with them!

And what is your defence

Defending the earth in three dimensions sounds pretty impressive. Thirteen-year-old Joseph Nicholson from Chilton tried out the latest offering from J K Greye Software.

The program loaded with its title and after about four minutes the program starts an impressive introduction (I'm sure you'll see the screen telling me that I will be the only space hero that the planet has and I must defend it to the last. Who, me? They must be joking).

When I bought this game I was under the impression that this was just an (average) version of the usual defender games (the one of 3D Defender isn't really played in my mind). The screen in 3D Defender is what you would see if you were looking through the cockpit of the space ship. The ships actually fly towards you in full 3D getting larger as they get closer. A few in the distance appear on the screen as well. It's rather an impressive 3D picture (after I've read you, no to my alien space craft). The number of ships you face and your score.

After pressing (space) the game began. The graphics are outstanding. After getting myself accustomed to the non standard movement keys (the game does not use the cursor keys to move, but the movement keys are arranged to simulate joystick control). Once this has been mastered

the game feels much more relaxed. I decided to try and save the planet from the incoming alien space craft as the instructions for the cassette put it. This was nowhere near as easy as it seemed. Whenever I got near to the targets they would either shoot their Plasma or me and shoot me down or I would actually collide with one of their space craft instead of shooting it. Every now and again enemies would shoot across the screen and if you hit one of them one of your lives would be lost. After about one hour, yes, one hour! I shot my first alien.

250 the score was, but that didn't stay there for long as everywhere an alien lands on the earth 50 points are deducted from the score. My score was reduced to 0 in about 30 seconds! It took me about another hour to really get the hang of it. It is certainly not an easy game. In the instructions for the cassette they told you how to alter the speed of the game, you can kill the alien. I decided to change the speed of the alien (person of course). You get out of the program by pressing the ESC key (the boss key has no effect). The second rather difficult as the

program recognised the SHIFT key as a key in its own right. I soon found that by pressing the 1 key (the key with ESC written on it) without the shift depressed it worked perfectly. Indication of the program revealed that the game was written almost completely in diskcode with only 2 lines of BASIC. A SAVE key (which makes a RUN automatically upon loading) and a RANDOM key (moving F10) led the alien to its slowest speed, the game was still fast, but not as fast as I couldn't play properly.

About the last key I can turn on the game is "GREAT". The game is good value at £4.95 with graphics second only to the real arcade game. My only minus for the game is that it doesn't take quite a long time to learn to play properly. But then most games (there's two angles because losing after a time anyway). Recommended.

You have been seen gulping...

I bought Campbell Systems GULP from W H Smith for £3.95. When I bought the game I was under the impression that this was a kind of one shoot. The main game under a

new menu. The only "new" thing on the cassette for playing the game was "Can you outwit the GULP?" (I'm not sure if GULP that's the name of the game or the name of the character). I had not much to go on. The game seemed to be a special order a name other than "GULP" as when I typed GULP "GULP" it didn't load, and when I typed LOAD it loaded very easily. It took about two minutes to load. The game auto ran. A menu appeared, it said "A PLAY A MAKE C SPEED O GRADE S PAUSE P F10 RANDOM F10 FOR INSTRUCTIONS". I pressed G. I was reassured that the game WAS a one shoot (as soon as I pressed the "G" key I was called a chaser). You have 5 lives and you have to keep the alien to the move. The more you eat the faster he gets. You have a choice of 5 different menus, when the alien gets up you can move. You are in G and you start in the middle of the screen (not all games start from the same place). You start in the left hand side. The character is an orange "B" and he starts in the bottom right hand corner. High scores are kept. Pressing (space) again appeared what the menu meant. The

speed of the game could be altered by pressing 0, and the appropriate number (1-9) and fire acceleration could be stored by pressing "M". Just the speed to 1 and the acceleration to 1 for the slowest game. The mass was already set at 1 as I pressed A to 100. The mass flashed up instantly, obviously written in machine code. It looked totally complicated. The game moved at a reasonable pace. One point I noticed was that your movement stopped directly a finger was lifted from the key. This is different from the movement in the arcade, and makes the game much harder.

The more locked things like power pits and tunnels but the fact that you could choose one of 5 masses and choose the speed and acceleration seemed to make the game still as good. In mass 5 the walls of the maze make the work "EASY". The game is very addictive and great fun, but I do have a few grumbles.

When the screen displayed all dots the game does not display a new screen. Instead it relies on you pressing the "Q" key to end the game.

Some masses have more dots than others, so if you wish mass 2 for instance, you could still beat the high-scores on mass 1. However, this problem is compensated for by a function that allows you to reset the high score.

My last grumble is that when a life is lost the player plays another dot in the square that he started off from. This means that to obtain the best score you have to lose all your lives. This seems pretty clear.

However, after all these grumbles I still stick to my

statement that the game is exciting, addictive and great fun to play.

Michael Orwin wins again

From Loughton, 15-year-old James Walsh puts Orwin's cassette three through its electronic paces... and lists what he sees.

Eight programs on one cassette? Sounds amazing, but how I got one of these programs was so good that they could have been copied out of the manual. Well, could this be different?

The first program is called "STARSHIP TROJAN" and the idea is that your starship is damaged and you have to repair it before becoming wrecked, which brings all visitors plunging into a supreme death. The graphics on that are superb, but the actual play is not a bit new for me. The second game is called "STAR TRIP" (angel 18). This is a good version of the well-known "you lost at space game". Again because it was on BASIC I found it a bit slow, but if you do not mind waiting around a mile you may find it very good. The next program is called "PRINCESS OF RAAL". Quite probably this is another adventure game — well a sort of another "Wishywashy", different levels and a whole host of dangers, a whole lot of different difficulty levels, it makes for a very addictive game. The idea of "PRINCESS OF RAAL" is to get from one side of the screen to the other without hitting the balls being constantly fired at you.

Tough this game is simple it also becomes addictive. Of the remaining four games the one that caught my eye first was *ALIENBUST* which is coded as being the easiest of the four and indeed it is a casual level corner CUBE which is a very well written simulation program of that dreaded third border.

Coming a very close second in eighth are *BATTLE* and *SECRET MESSAGE* both of which I found interestingly good.

Conclusion

I cannot comment on the documentation as I did not receive any. But I am assured that it is about as A4 pages long and comprehensive (it would have to be for some of these games). Altogether it is a well produced good value for money cassette with eight very good to mediocre games on it.

Cassette 4

Michael Owen seems to have got into the habit of taking screenshots of eight games all of which could have been sold separately for the same price, whilst the eight on one high quality cassette for £5. The only way I can do true justice to these programs is by looking at one or at three and it is a difficult cassette.

Of *230: Scramble* has been written and marketed by other people, but this is by far the best version I have seen for the ZX81. The graphics are excellent and the speed is incredible for a machine code program.

Of *Starlight* this is one of the arcade type games which I definitely have not seen before.

on the ZX81. Although the name is misleading the idea is that you are one of two astronauts on the screen and whilst not letting the stage crash which moves steadily up the screen, as one of the more often you must try to adjust your opponent. The graphics are excellent and this is definitely the best one-on-two player graphics game that I have seen for the ZX81 to date.

Of *INVADER* Yes, I know another invader game and you've seen them all before, haven't you? But this one is actually a better than any other I have seen on the ZX81. The graphics are far better as you have three alternatives for each invader. The only thing that I found difficult was that the game did not ship and return when you are lost.

Of *GALAXY INVADERS* this is a very good machine code version of the *Galaxies* game with very 'pretty' sweeping stars.

Of *SHOOTER* This is not quite as a graphics mind blowing as the last two, but with the solid robust walls, by which and where the speed of the game is very addictive game. Oh I nearly forgot, the idea of the game is to kill the snake's tail first before it eats you.

Of *LIFE* A cleverly written version of the well known game with good graphics.

Of *3D TIC TAC TOE* This is the only BASIC game on the tape, which means it is slower, but it is an advanced and addictive version of the game.

Of *FLUKEAUCUS* Last but definitely not least we come to the most original game, *Flukeaucus* which is easily as addictive as *Invaders*. Although

the game is original there was no need to make the game so obscure. It has vague similarities to music games, as the elements combine to form as it grows, changing notes. A word but definitely wonderful game.

Conclusion

If this game was on a separate tape and selling for £5 each I would still recommend them. But at only for £5 — I like the fact that the money you have not been seen before for any personal computer. It is interesting to note that out of the many software companies in the country, Michael Owen is one of the few which has managed to continue to grow even after the Spectrum was introduced.

Without sounding petty, I would like to conclude this review by saying — if you have a ZX81 and like games, then you should buy Michael Owen's cassette 4.

Available by mail order only from MICHAEL OWEN, 25 Broomfield Road, Welwyn, LONDON NW10 3DL.

More pieces of eight

Following the recent launch of his first ZX81 cassette *Beginner Bytes One*, Richard Shepherd is now offering a second, *Beginner Bytes Two*. As with the first cassette it features eight varied programs for £5, but there are two extras. Firstly a short test program at the start enables correct volume levels to be determined, and secondly is now presented within 24 hours of the order being received.

The new cassette features *Smoking Adventure* in which the player commands a ship and tries to win promotion by superperformance in battle. *Skilful* application of resources is vital. Supplies, men and ammunition must be carefully calculated and timely obtained.

When supplies run low, it becomes necessary to return to port for them to be replenished. Naturally the journey is fraught with the battle hazard, but a determined player can battle his or her way up the career to become First Sea Lord.

Other major games on the cassette are *Stock Market*, in which the player must make instant buying decisions on market information flashes up; and *Naughts and Crosses* which is on three levels, easy, medium and impossible. There is also a *Pub Quiz*. *Pratt* features complete with random hints, systematic nudges and a warning counter. A moving graphics *Star Wars* rounds up the games section.

On the educational front there is a *General Knowledge Quiz*, (with three levels), *Copycat*, an arithmetic Simon game, and a profitable even point calculating money model.

Beginner Bytes Cassette Two is available now from Richard Shepherd, 33 Green Lays, Wetherford, Berkshire, SL6 7HD. Telephone (0494 6) 31103. Price: £5 including postage and packing. All programs require 128K Ram Pack.

Campbell Systems (202P).

Programming your computer for board games

There is one common thread which can hold together computer programs for such games as draughts, chess, reversi and even Nine Mens Morris. Tim Hartnell reveals the secret, and shows how it can be used to write an intelligent board game — from scratch.

Look first at diagram one. It shows a draughts or chess board, numbered to make it easy for a computer to handle. You can indicate any square on the board by referring to the number along the left hand side (such as 3) then the number along the top (such as 4). In this case, the line numbered 3 along the left hand side and the line numbered 4 along the top meet at the square numbered 34. If you wish to move a piece, you could do so by entering the number of the square you're moving from (such as 55), then the number square moving to (such as 66), and the computer can understand exactly what you are doing. There is no need to change the numbers entered by the human player into another set of numbers in order that the computer can interpret them.

That's the first 'trick'. The second is that the board numbered in this way has another great advantage over a board which is simply numbered from one to 64 in order. When you move in one direction, no matter where you are on the board, the difference between the squares is the same.

I'll explain that somewhat cryptic statement. If you move one square up and to the right — like the move of a pawn in draughts — you will move from, say, 24 to 25, or from 52 to 54, or from 71 to 82. But notice that no matter where you are on the board, the difference between your starting and ending squares is always

	1	2	3	4	5	6	7	8
8	81	82	83	84	85	86	87	88
7	71	72	73	74	75	76	77	78
6	61	62	63	64	65	66	67	68
5	51	52	53	54	55	56	57	58
4	41	42	43	44	45	46	47	48
3	31	32	33	34	35	36	37	
2	21	22	23	24	25	26	27	28
1	11	12	13	14	15	16	17	18

Fig 1. A draughts board with a computer can use it. All the squares are numbered up to 88, and this is what the machine can be told exactly where to go!

11. If you move diagonally up to the left, you'll move from, say, 28 to 29 (plus 9), or 88 to 79 (plus 9) or 22 to 31 (plus 9).

This predictability makes it relatively simple to create a board which the computer can handle.

Imagine the computer has a draughts piece on the square numbered 28. It could be programmed to check each square on the board, and every time it found one of its own pieces, could check if there was a further piece on the square numbered that is, 29 in our example plus 11 (ie, on 39), and it could check to see whether the square 11 beyond that (ie, 49) was empty. If it found all these conditions were true, the computer could jump over square 28 into square 49, and capture the piece on 39.

Thus, in essence, a fairly fancy computer board game — from draughts, through Reversi to chess — works based on a simple 8 x 8 grid numbered in this way:

If you were writing chess on the board, you could easily do the moves on, for example, by knight, by knowing that it can always move to squares which are the following distances from its own squares: 21, 12, -6, -19, -21, -12, 19 or 8. Try it now, by placing a coin on square number 88, and move it as if it was a knight, working out the mathematical relationship between the starting square, and the square you're moving to. You should find the differences are the same as the numbers just listed.

The Pieces

Let's move on now to produce a board game, making use of the information we've discussed so far in this article. We are going to write the CORNER CHECKERS, which will be a game which the name is draughts, except that it is played by starting in the corners of the board rather than the ends: there are no multiple jumps and no kings. Any piece may move at any diagonal direction. Captures are as in draughts, by jumping over an opponent's piece into an empty square, always moving on the diagonal. First we need an array to hold the pieces. We'll start the program with a title, and a GOSUB to send us on to line 9000.

It is a good idea to assign the

variables at the end of the program, so it makes the program run a little more quickly once the subroutine has been run (as it avoids going right through the variables assignment) section every time the computer is going through the program, and he has, to find a GOTO or GOSUB address) and if you suddenly discover, when you're writing a program, that more variables are needed, there will be no storage of places to put them, which there could well be if the variables were assigned at the start of the program.

The first 'main program' we'll enter, then, is program one. Next, we have to decide which squares on our board will be occupied by pieces, and what codes we will assign to those pieces. We'll be playing on the black squares in the game, placing the human pieces on 11, 13, 15, 23, 24, 31, 33, 42 and 51. The computer's pieces will be on squares 66, 68, 77, 88, 84, 75, 66, 57. All other squares will be empty, and there will be — of course — other squares (such as those with numbers below 11 and above 88) which are off the board.

We need to assign the values to the elements of the A array, which we do by running through a loop, from one to 100.

Look at lines 9010, 9020, 9030 and 9040 in program two. There are acting as 'data statements', holding the

```
10 REM CORNER CHECKERS
20 GO SUB 9000
9000 STOP
9000 DIM A(100)
```

Program One: the opening lines of a ZX Spectrum game. The array is to hold the pieces in the memory of the ZX Computer

```
9000 DIM A(100)
9010 LET H="111315232431334251"
9020 LET C="666877888475665742"
9030 LET S="131416181923252732"
9040 A(11)=1:A(13)=1:A(15)=1:A(23)=1:A(24)=1:A(31)=1:A(33)=1:A(42)=1:A(51)=1
9050 FOR Z=1 TO 100
9060 LET A(Z)=0
9070 NEXT Z
9080 LET H=CODE "-"
9090 LET C=CODE "-"
9100 LET S=CODE "-"
9110 FOR Z=1 TO 9
9120 LET A(Z)=H
9130 LET A(Z)=C
9140 NEXT Z
9150 FOR Z=1 TO 39
9160 LET A(Z)=H
9170 LET A(Z)=C
9180 NEXT Z
9190 FOR Z=1 TO 14
9200 LET A(Z)=H
9210 LET A(Z)=C
9220 NEXT Z
9230 LET C=CODE "-"
9240 LET H=CODE "-"
9250 PRINT AT 2,1;"DO YOU WANT TO PLAY?"
9260 INPUT US
9270 IF CODE US=CODE "Y" THEN GOTO 9000
9280 RETURN
```

Program Two: this section of the program sends the starting position of all of the pieces in the game. It also assigns codes to the new variables used.

```

8000 REM **PRINT BOARD**
8010 PRINT AT 3,0,"COMPUTER : "
8020 TAB 10,HUM:,"HUMAN : "
8030 PRINT AT 5,0,"19345678"
8040 FOR Z=0 TO 3 STEP 1
8050 PRINT TAB 8,"2,3,4,5,6,7,8"
8060 FOR Y=1 TO 8
8070 PRINT CHR$(R1932+X),
8080 NEXT X
8090 POINT "B"
8100 NEXT Z
8110 PRINT TAB 5,"19345678"
8120 POINT TAB 8,"2,3,4,5,6,7,8"
8130 IF COMP=7 THEN PRINT AT 3,0,"I WIN".END
8140 IF HUM=7 THEN PRINT AT 3,0,"YOU WIN".END
8150 RETURN
8990 STOP

```

Program Three: a contest part of our chess game! The first output prints out the board and the position of all of the pieces. Don't forget to add on line 33 before you try to run this section!

```

7000 REM **PLAYER HOME**
7010 PRINT AT 19,0,"ENTER YOUR M
OVE: RS -12345678"
7020 INPUT RS
7030 IF LEN RS<4 THEN GOTO 7000
7040 PRINT AT 19,0,"
7050 LET RSURL RS:1 TO 3:
LET RSURL RS:10 TO 4)

7080 LET R19345678
7090 IF RS= (R-8):11 THEN LET R1
(R-8):2)=E
7100 IF RS= (R-8):11 THEN LET HU
(R-8):2)=E
7110 RETURN

```

Program Four: the extent of the subroutines employed in the game is that to move and record your move or the human move. For more and line 40 in Program One in order to utilize the routines in the game.

```

8000 REM **COMPUTER HOME**
8010 FOR Z=0 TO 11 STEP -1
8020 IF R12=C THEN GOTO 8050
8030 NEXT Z
8040 GOTO 8200
8050 LET Y=-11
8060 IF Z+Y>8 OR Z+Y<11 OR Z+8*
Y<0 OR Z+8*Y<11 THEN GOTO 8070
8070 IF (Z+Y)>11 AND R12+8*Y)=C
THEN GOTO 8100
8075 LET Y=-8*Y=(11)+8*Y=-8)+1
1+Y=-1+Y-(188)
8080 IF Y<0 THEN GOTO 8050
8090 GOTO 8200
8100 LET R12=C
8110 LET R12+Y)=C
8120 LET R12+8*Y)=C
8130 LET COMP=COMP+1
8140 RETURN

```

Program Five: after adding on line 40 as outlined in the text, you are ready to give the 33 challenge! This program allows your computer to think and possible captures and action then.

numbers of the squares which will be assigned. He helps the starting human squares. On the starting computer squares: 64 the empty of "black" squares there are white on our numbering system, but are black here to give a good appearance when the game is underway, and 64 for squares which will be empty at the start of the game, but which will be used for playing an empty the game and another.

The first routine after the "data" statements, lines 8000-8050 and 8070, give a value of 0 to all squares. The value will later serve as an indication of left the board. The lines from 8080 to 8100 give the values which will be assigned to the other squares. The variables are given values to make it easy to keep track of them during the game. If for human's piece, C for the computer's, 1 for an empty square and 0 for a black one.

Having run program two we need to check that it is working correctly by printing out the board and seeing if it is correct. Note that the RETURN line is numbered 8000 to give as much room as needed for working later your program up to the end of program two, and make sure it runs through without a hitch. The code 8080 shows it is working perfectly. We will put the subroutines to print the board starting from line 8000. Add

8000-8050 and then add program three, and run the whole program again.

If it goes well, a complete board, set up for CONVERS CHECKMATE, should appear. Once it has and it is very pleasing to see the board on the screen as it looks far stronger than the printing, would you just, add 8130-8150, and you are ready to add the next part of the game.

Human Mover

The human moves are the simplest to program. In essence, all we need is an input to take the square the human is moving from, an input for the square the human is moving to and a routine of turning the "squares from" blank (0) and the "squares to" move human square (1). It is also useful to check that the human is not clearing and there will have to be some mechanism for "moving" pieces which the computer has picked over, but — for now — let's just arrange for a simple non-capture move. We'll start the PLAYER MOVE routine at line 7000. Add 40-8000-8000-8000-8000, then enter program four.

Run this, and enter your move as suggested on 3344 — that is two numbers, if all is well you'll see the "H" move from square 33 to square 64. The program will keep cycling in its present form. Try moving a few other pieces, even some

puter places. You'll see there is one check, line TD00, to make sure the move consists of four numbers.

This program evaluates a line to remove a piece which has been captured. Look at our master captured board. If the piece moves from 40 to 64 and there is a computer piece on 63, the piece on 63 must be removed. Fifty three is half of 106 plus 64, which gives us an easy way of finding out which piece to delete. The bot some captures, making sure the

captured piece vanishes, and the human side is re-oriented.

Once you're happy with this we start the biggest task of all, adding 'computer intelligence.' We'll start the computer's thinking subroutine at line 6000, so add 60 G0446 6000.

Computer Mover

Let's think about how the computer can be 'taught to play.' It must first scan the board,

square by square, looking for any and all possible captures, so obviously it needs a loop of some kind. Look at lines 6010 to 6040 in program five. They go through the board square by square, looking for a piece and once one is found, goes to line 6050 to find out what to do with that piece. The reader who follows the squares on the board is plus eleven and minus eleven plus nine and minus nine. The computer knows that if a human piece is on, say, a square eleven more

than it is, and the square beyond that (the square number plus two) times eleven is empty, it can capture by jumping into the empty square. Add the line between 6050 and 6200 (program five) and set up a routine or have for the computer, by moving some of your pieces in to danger. It is fascinating but quite pleasing to see the computer finding possible captures, and making them. Random moves are the next thing we should implement.

We add the line from 6200

enwards (program aim) to achieve this. There are a number of things we need to do for "intelligence" (i.e. non-specified moves). First a piece (line 6360) and then check around the piece (from line 6360) is a routine that we are not moving the piece into a potential capture situation. If, after 200 squares have been checked in this way, no move can be found, the computer goes to 6500 and chooses 200 more squares, the time not checking to see if it is moving into danger. If no moves can be

found, it goes to line 6500 and chooses a default. Following through the possible moves will show you how this (somewhat complex) routine works. Finally, add the remaining lines for the main loop (program event), which keeps the whole thing working underway. The game continues until one of the players manages to capture most of the opponent's pieces. There is quite a lot you can do to improve this game, including speeding it up by ensuring that when it picks squares

it renders it does not select the as the direction than once many particular moves. Also, the printing of the board (especially the numbers down the left hand side of the board) slows the game down. You may well be able to improve this. The final edge of the article shows some changes in a typical game against the program. In the last issue of *24 Computing*, Terence had sent out a way of modifying the program to give display which fits the screen, including play-

ing pieces which you define yourself. As well, he had also how "Corner Checkers" can easily be changed into "Special Checkers". A way to change the board substance to only the chosen piece is mentioned will also be discussed. Ken Marshall is particularly interested in examining how some of the program given in the article, and is looking a program derived from it. The last issue (and complete description, and further help) please will be used in the next Computer issue of *24 Computing*.

```
6260 REM #=NCH-CAPTURE MOVE#
6270 FOR I=1 TO 200
6280 LET J=INT (RND*76)+1
6290 IF A(K)=C THEN GOTO 6260
6300 NEXT I
6310 GOTO 6500
6320 LET Y=-1
6330 IF A(K)=E THEN GOTO 6330
6340 LET Y=ABS(Y)+1+ABS(Y)-1+1
6350 IF Y=0 THEN Y=100
6360 IF Y=0 THEN GOTO 6370
6370 NEXT I
6380 GOTO 6500
6390 IF K+2*Y>66 OR K+2*Y<11 THEN GOTO 6400
6400 IF A(K+2*Y)=H THEN GOTO 6240
6410 IF K-2*Y<11 OR K-2*Y>66 THEN GOTO 6400
6420 IF A(K-2*Y)=H THEN GOTO 6240
6430 LET A(K+Y)=A(K)
6440 LET A(K)=E
6450 RETURN
6460 FOR I=1 TO 200
6470 LET J=INT (RND*76)+1
6480 IF A(K)=C THEN GOTO 6500
```

```
6500 NEXT I
6510 PRINT AT 0,0,"I CONCEDE THE GAME"
6520 STOP
6530 IF A(K-1)=E THEN LET Y=-1
6540 IF A(K-1)=E THEN GOTO 6400
6550 IF A(K-1)=E THEN LET Y=0
6560 IF A(K-1)=E THEN GOTO 6400
6570 GOTO 6540
6580 RETURN
```

Program 10, when no pieces are being taken. The game involves a single 4x4 board, desirable to have the computer make a random move occasionally so that you can see the position and design. The computer will move in an occasional way but that just might be useful.

10 CORNER CHECKERS
20 GOSUB 6000
30 GOSUB 6000
40 GOSUB 6000
50 GOSUB 6000
60 GOSUB 6000
70 GOTO 30

Program 10, after all the subroutines are defined, will look like this. It should look like the program in the next issue is a different version of the program in the next issue, a full interactive game.

Do you think you're smart? Well, try and beat the program. Before you know it, you'll find the game through shows each column in turn and see if you would have done any better than my friend who who, although he got told that that is in fact, ended up losing out by the 100.

The computer move routine is surprisingly effective in games like this where the moves are strictly limited in type and a known sequence is that most of the time. Your best chance of getting to the end of a sequence is to just random drive and then speculate on it. If the 100 shows in a game move instead. Forget it!

TROUBLE FREE PROGRAMMING FOR ONLY £13.95 INC. V.A.T.

1-1-80 (1/80)

**WITH THIS BACK-UP RECHARGEABLE BATTERY PACK AND MAINS FILTER
NO MORE PROGRAMME CRASHES DUE TO MAINS FLUCTUATIONS AND TRANSIENTS**

If you use or upgrade the ZX81 system, you know the frustration and problems caused by sudden drops in the mains supply or high voltage transients. House of Electronic Programming can be lost in a flash in a second.

Here at **ADAPTORS AND ELIMINATORS**, who are one of the largest suppliers of mains adaptors to the computer industry, we have developed this rechargeable battery pack and mains filter.

- No more programme crashes due to mains fluctuations
- In the event of a power cut your computer will run for up to 30 mins, allowing you to reload your programme on a battery cassette or print a hard copy on your printer
- This battery pack is also a useful source of 5v power for use on radios, tape recorders etc. Use your adaptor to charge overnight.

Operation could not be simpler. Plug the lead from your ZX81 adaptor into the socket on the battery pack (make certain as previously). Then using the lead supplied connect the battery pack to your ZX computer or Spectrum.

This battery pack then provides instant back up to the adaptor, leaving you to programme without fear of crashes due to the mains. (After mains supplies are responsible for about 95% of all programming faults.)

The package housed in a smart ABS case and comes complete with full instructions. No wiring required — JUST PLUG IT IN! We urge you to protect your programmes. Order now — Only **£13.95 + P.V.P.**

PLEASE NOTE: This pack is suitable for all computers using a 5v supply but you may need to change the plugs.

ZX81 AND SPECTRUM SOFTWARE SECTION 1: GAMES

BOULETTE ZX81 and SPECTRUM £4.95

Boulettes is a fast paced game for up to 4 players. It is a variation on the classic game of pool. It is a fast paced game for up to 4 players. It is a variation on the classic game of pool. It is a fast paced game for up to 4 players. It is a variation on the classic game of pool.

TIME BANGERS ZX81 and SPECTRUM £4.95

Time Bangers is a fast paced game for up to 4 players. It is a variation on the classic game of pool. It is a fast paced game for up to 4 players. It is a variation on the classic game of pool.

RAMPAGE ZX81 and SPECTRUM £4.95

Rampage is a fast paced game for up to 4 players. It is a variation on the classic game of pool. It is a fast paced game for up to 4 players. It is a variation on the classic game of pool.

SECRET VALLEY ZX81 and SPECTRUM £4.95

Secret Valley is a fast paced game for up to 4 players. It is a variation on the classic game of pool. It is a fast paced game for up to 4 players. It is a variation on the classic game of pool.

THE GREAT MISTERY ZX81 and SPECTRUM £4.95

The Great Mistery is a fast paced game for up to 4 players. It is a variation on the classic game of pool. It is a fast paced game for up to 4 players. It is a variation on the classic game of pool.

All programs require 100K minimum RAM. These include programs and full instructions supplied.

P. F. L.

HIGH QUALITY PROGRAMS TO HELP YOUR CHILD LEARN

P.F.L. is currently leading a new series of educational software and the first programs are now on sale for sale to use on Commodore and Sinclair micro computers. The software is specifically designed to provide extended drill and practice in pre-set exercises for children aged 7-11 in the following subjects:

- English
- Arithmetic
- Vocabulary
- Reading and Spelling
- Handwriting
- Reading and Spelling

Each program has been meticulously designed by highly qualified experienced educationalists and written by professional programmers. It has been demonstrated that these programs really stimulate children's enthusiasm and do help them to realise their academic potential. They will be of great value to parents and teachers to normal children and remedial learning and also for those learning children for Common Entrance/Preparatory School Entry examinations.

We further advise parents write to P.F.L. with addresses where, stating whether you are a parent or teacher, the level of computer facilities and in which subjects you are interested.

The Hartnell's previous books have been warmly welcomed by the computer press.

"... This is undoubtedly the book to read ..." *Personal Computer World*
"... A book to be recommended ..." *Computing Today*

The book you've been waiting for!

This is a book that will allow you to make the most of the ZX Spectrum — a book that will lead to your expert programmer status within weeks.

There are two major sections — the first for those who have no previous experience of computer programming and the second containing advanced material for really powerful programming. All sections of the book make good use of the full eight colours, sound generation and high-resolution graphics. You will also be shown how to make the most of Sinclair BASIC features such as DEF FN, SCREEN, MERGE and FLASH.

Key features of 'Programming Your ZX Spectrum'

- Using the colour effectively — BRIGHT FLASH, INVERSE and more.
- Sound — there's more to the BEEP than meets the ear.
- Finding your way around the keyboard: the use of every keyword, command and function.
- High resolution graphics — how to use them for stunning displays, how to create your own version of the famous arcade game *Pacman* with user defined graphics.
- The ZX Spectrum has the full ASCII character set and this book includes a word processor program to make best use of it.
- The Spectrum LOAD and SAVE is highly reliable and the MERGE and VERIFY features increase its flexibility. Programming Your ZX Spectrum outlines simple ways to ensure you never lose a program.

The ZX Printer

All program listings are dumped direct from the ZX Spectrum so all programs are guaranteed to run.

The Microdrive

An appendix to this book details the commands needed to use your ZX Spectrum with the Microdrive microfloppy so you'll be ready when it comes on the market.

Hit the deck

John Butler and Dave Groombridge have written this program in which you have to try and land a plane on an aircraft carrier, during a particularly violent wind.

The screen display shows an aeroplane in the top left hand corner, with the sea at the bottom, and an aircraft carrier landing platform in the right hand corner.

The idea is to land your ZX80 aircraft onto the screen's sea, taking note of the very gusty wind conditions graph to gauge the chance of a safe landing.

These reports are given by a meter at the bottom of the screen, showing values of WIND (asterisk), W (wind direction) or MIL WIND.

If a westerly wind is prevailing, you will have to enter less power (power values are 0 to 255), and the opposite for an easterly wind, when you find the ideal landing speed (power input is around 80 knots).

If you are too high and underbushy overhead, press any key to abort your approach again.

This program fits a 10 ZX80

```
180 DIM A(17)
190 FOR I=0 TO 17
190 PRINT I
180 INPUT X
190 LET A(I)=X
200 PRINT A(I)
210 NEXT I
```

PRESS RUN AND ENTER NEW LINE

(This will produce 0 on the top left hand corner of the screen. Enter the following values in turn, pressing NEW LINE between each value.)

```
0-3-8-134-4-7-0-128-133-132-128-189-0-0-0-133-0-0-0-0
```

PRESS NEW LINE

(The above lines will be over written in the following listing.)

```
10 LET V=100
20 LET L=2000
30 LET S=1/100
40 LET D=1
50 GOSUB
60 IF D<3 THEN GOTO 250
70 IF D=4 AND K>5 THEN PRINT "OVER SHOOT"
80 LET J=50
90 PRINT
100 IF J=5 THEN GOTO 130
110 LET J=J-1
120 GOTO 60
130 IF D=3 THEN GOSUB V
140 IF D=2 THEN GOSUB V
150 IF D=1 THEN GOSUB V
160 FOR I=0 TO 3
170 FOR K=5 TO 5
180 PRINT CHR$(65+I)*K
```

```
190 NEXT K
200 PRINT
210 IF D=3 THEN GOSUB W
220 IF D=2 THEN GOSUB W
230 IF D=1 THEN GOSUB W
240 NEXT I
245 IF D=4 AND K>4 THEN GOTO 500
250 LET P=5
260 IF P=3 THEN GOTO 310

```

```

710 RETURN
900 INPUT B
910 IF B= THEN THEN GOTO 1

```

DO NOT PRESS RUN (This will close all the solutions)
GOTO 1 NEW LINE

Pegging about

Housed, Harris, is the heart of Michael Delacorte, whose he Z800 has cooked up this program for the game of peg solitaire.

Putting an unpegged Z800, the program holds the board as an array of seven elements with positions position defined by two bits. Therefore, each array element defines a row of the board.

The first digit defines the first column (1-7), numbering from left to right, and the second digit defines the row (1-7), counting from the bottom to the top.

The last move will always therefore be 44. The program tests for the end of the game, although it cannot detect a single move position.

```

10 DIM A(7)
20 LET A(1)=2016
30 LET A(2)=A(1)
40 LET A(3)=32768
50 LET A(4)=32032

Abstract

Let's go ahead and add a new page to the 2nd digital output. I'll start for many other digital outputs as you'll be required to add more as the pack is built.

[illegible]

Controlled via our Anti-Fraud
management (2008) a first
prevention measure

Age Group	Male (%)	Female (%)
18-24	100	100
25-34	100	100
35-44	100	100
45-54	100	100
55-64	100	100
65-74	100	100
75-84	100	100
85+	100	100

As a result, you will
be very successful in
the new world and you will
own it.

² In principle, externalities could be internalized through a range of arrangements and instruments, as it might be possible to make the user of land bear the costs of the damage (perhaps through taxes). But in practice, the cost of internalizing such externalities is often substantial or insurmountable.

Abstract

THE TOMB OF DRACULA!

3D HORROR ADVENTURE GAMES

Outgunning over 10 GB of memory, a superb 3D graphics adventure game for the Z400 with VGA RAM for only \$9.995! Order: Download's ready at 30 minutes to instantly

of the most famous, though he found a few innocent 1000 yards in search of the blood vampires a Tuesday night as a vampire after release and see them in actual vampire against the living humans. groups standing out of the darkness. See them at all on the 20th of the year of the year when will let you. Take a drink on a Mexican. Vail of your deal! And all the time the means are falling in to sunset, when Dracula runs from his coffin and comes after you. Each of the infinite waves of the world that no one 200 yards or so deep as you like. The Power of Gardens will send you out to the moonlight.

WARNING The people of the exceptionally stupid characters should play the game only during the hours of daylight. Natural lighting creates a game in progress to be over on that to you can notice it whenever you choose.

Free at only \$2.99 includes ready-to-load cassette with library case and tape. Full instructions, postage and packing. Order today! Money refunded if not delighted! Send with \$1.00 or check to:

Spectrum workstation

Following the success of our 2201 pilot, we have introduced a replacement for the Spectrum. This system APO pilot uses an LED light TV for better viewing whilst keeping the Spectrum and making frequency use. The PSL system is available. The pilot and cassette may still be used and a matching rackable unit for APO can be used for evaluation.

Waterbury, Connecticut, and 11 Springfield-based industrial plants.

Getting a little joy

Jeremy Ruston takes a firm grip on a Microgen Joystick . . . and likes what he finds.

The Microgen joystick system costs £19.90 for the controller board and £9.90 for each joystick — a maximum of two can be attached.

The controller board fits between the ZX81 edge connector and the ISA Solid pack. This arrangement may look a little unattractive, but I am assured that due to the fact that the ISA Solid pack is not a slightly different angle, it is fully supported by the table, which apparently clears up the lingering problems with the pack.

The side of the board, which was exposed, has two sockets for the two possible joysticks. The standard of construction of the board is very high, although sockets have not been used for the nine integrated circuits — which if anything makes the connections more reliable. Besides the ICs, there are 20 or so discrete components, and a potentiometer on the board. The potentiometer is used to adjust the range of values generated by the joystick. This chip needs to be done once, and Microgen supply a short program to assist in setting the potentiometer.

Making up for x

The joystick, themselves, are made by Radio Shack (I'm not, and look rather like a RAM pack, with a pencil sticking through it. The stick itself does not return to the central position when it is released, but it is very sensitive if you like it to or not.

The cable supplied is good and long, so even if your ZX81 is forced to sit within two feet of your TV by Shireen's idea of a serial lead, you can play games from a decent distance, in case you

te and from location 16000 (decimal). Before reading data from the joystick it is necessary to PEEK a number in the location, to specify whether you wish to read Joystick 1 or 2, and whether you wish to read the X or Y values. That is basically all there is to using them, except that if a value greater than 128 is read, the fire button (pressed on each stick) is being pressed. I found it very easy to write

simple programs using these devices, even if machine code and any game written in BASIC should be easy to convert.

In Conclusion

To sum up, I feel these make interesting peripherals for the ZX81 (and probably ZX80) enthusiast — and a no-brainer — the system does come out to be impressive in relation to a ZX81 and its form.

Thoroughly recommended

As is pointed out, I am full aware that the Microgen office are developing a range of quality games (about a month's time) to use the joystick, including Space Invaders. I was supplied with a test game, which they at Microgen called a side 8 game, which was fairly impressive.

Many thanks to Microgen for the review joystick.

So much for the hardware, but what of the software? All data is shared between the computer and the joystick and made by PEEKing and POKEing

Jim Archer of Frimley, Surrey, puts you in command of your ZX81 in a well written GRAND PRIX program.

At the first lap, the average time/lap is given in minutes and seconds and the driver is placed between "A" and "C". Only the best can attain an "A" — the "C" will be made.

100

Going Gregorian

Want to know what day it is? Just get out your ZX81, fiddle with the 16K pack till it sits in place, connect up your recorder, wait a week or two while this program loads . . . and there you are.

1982 Desk Calendar

The program is designed to print out the calendar of any specified year accurately and neatly, or show just a particular month of interest, or alternatively to state on which day of the week any date falls.

It will work for any date after 1752 (when 11 days were added to correct the Roman Calendar).

This program will be especially pleasing to people with a few grams to spare and a wall calendar. Just use COPY for each month displayed.

CALENDAR was also written by Jim Fisher.

Edinburgh rules O.K.

The Edinburgh ZX Computer Show, organised by Gordon Hewitt and the Edinburgh ZX Users Club, was a resounding success.

Over 15000 people attended the one day show, held in the entrance foyer to a sports stadium, stretched over a quarter of a mile, drawing a long line was needed to get into one end to the other. Exhibitors at the fair

included Logan Software, Heaven Information Arts Computing, Kallit Micro Systems, the local WH Smith store, helped out a lot to help publicise the show, and sponsors a very good force is the prize for the promotion of computer use. Richard Shephard Software, JMS Software, Piddish Electronics, With Computer Services (What Can I Do with 1671) and Video Software Ltd

Club members provided a continuous demonstration of the capabilities of the ZX computer at the Edinburgh ZX Computer Show

Show organiser, Gordon Hewitt

Ben Logan on the show with the book he wrote with Dr Fred Of Man. Simultaneous ROM Assembly - Part 2

Martin Givley, author of '3d Drawing Using the ZX Spectrum' came over from Glasgow for the day

What People are Saying

As can be imagined, a number of publications in America have taken note of the ZX81 and Dave Sinclair.

In March *Fortune* magazine described Clive as 'the celebrity 4-1 year old boy' and now as an 'eccentric wizard who kept 100,000 his entrepreneurial spirit crossed'.

Like the Radio Hipsy Sinclair's major success added the ZX81 was an instant and overwhelming success... So popular has the machine proved that it has spawned over 1,800 new businesses from

manufacturers of add-on hardware to publishers of fan magazines and software. Nigel Slater, who was head of Sinclair Research in Boston Massachusetts, but is now in charge of the software division of Sinclair Research in England, told *'Fortune'* magazine: 'The Sinclair phenomenon is to enter those areas that are worth writing but that no one else was then going to enter.' In May the American magazine *'Popular Computing'* under the headline 'Big Power in a Small Package' had just after the ZX81 'The arrival of the ZX81' was an electronic match. Despite obvious imitations the Sinclair ZX81 is well designed, very useful and a bargain. Although its current uses are limited to learning BASIC and a few small application programs the ZX81's popularity has given the Sinclair the ability to achieve much more. By the end of the year there may be more ZX81's in the world than any other computer.

Small size and a low price do not have to restrict a computer's capabilities. That was the headline for a review of the ZX81 which appeared in Radio Electronics in April. It has already stated that when someone said that no machine could do it so it was only natural that he brought out a

full featured 8 byte micro computer for under £200. When you first look at the ZX81 it looks like a very modest micro computer yet its developer is back to defend its capabilities.

When the new version of the ZX81 was introduced at a Sinclair press conference late last year Slater said it was 'not a reduced support machine'. The language it uses is complete. Paul Electronics concluded 'In the final analysis the ZX81 is a building block until it is intended to train people who know little or nothing about computers, that is all it is intended to be.

At the end of last year *'Business Week'* which described the ZX81 as a dirt cheap personal computer ran a story on Sinclair under the headline 'A British Computer Hits It Big'. The article quotes a Computer World writer who describes an industry valuation as saying: 'Sinclair is getting bigger by the day. It's not a question of price performance it's only a question of price. Sinclair has found a segment of the market that no one else has found. It seems to be a big one.'

Lee Solomon, writing in the March issue of *'Popular Electronics'* says: 'The value is proof in the amount of computing power that Sinclair packed into such a small computer. You can carry the 80 lb wonder in a jacket pocket without making a budget.' The BASIC is as good as anything around in small computers and has commands that others do not have. The 104 page manual is one of the best we have seen. There are many typically British expressions, but most readers will readily understand them.

The Sinclair ZX81 looks like a winner for those who want a low cost way to learn BASIC programming in a small, inexpensive yet powerful computer to start out with. The old news about good things coming in small packages is true in the case of the Sinclair ZX81.

Clive just ran past him in the crowd at the 1980 London marathon along the Cambridge Road. Every runner got a number during the major race Clive. A number of several thousands including the New York marathon runner who ran the distance and driver of the finishing line during the race for over.

Expressing an Interest

The response to this best-mailing was so good they decided to offer it to 3,000,000 of their card holders.

At the end of last year in America the American Express Credit Card mailed a selected number of their card holders with a catalogue which

included the ZX81.

The response was immediate and they had 2,000 orders by noon the first day after the offer was made. Margaret Sinclair, who is the head of Sinclair's presence in America, said that since the offer was made they'd continued to sell at nearly 2,000 a day.

The £49.95 ZX 81

The ZX81 price has been cut, as was expected, from £59.95 to £49.95.

As well as the price cut Clive has decided to push the ZX81 through retail outlets in addition to W H Smith.

Two other retail deals have been announced, and discussions with others are said to be at an advanced stage.

Bird and Beams, a subsidiary of Bechtelms, will sell the ZX81 and the associated official software, and Paces Microcomputers will

sell the ZX81 as a wholesaler through high street computer shops.

This means that, for the first time, the ZX81 will be found like nearly all other computers and the numbers of units believed to be around half a million or even to well over there.

The ZX81 is being produced at a rate of 50,000 a month. It is not clear how many of these are destined to end up in America, miraculously transformed into ZK, Zorro/Zenith 1000's.

Sinclair gets the nod

After being excluded from the BBC program and from the government's "Let's put a micro in every secondary school" scheme, no one could have blamed Clive and his gang for feeling that someone up there didn't like them.

Well, at least someone up there (Major Thatcher) to be precise has discovered what an invaluable fellow our Clive is and what a splendid computer he has built.

With much going, the Industry Minister, Kenneth Baker, announced that it is a plan to equip all 25,000 primary schools in the country with at least one microcomputer, these computers will be officially approved: the BBC microcomputer, the Research Machines 4802 and the Sinclair Spectrum. The BBC machine and the 4802 were the two approved for secondary schools.

The only fly in the particular

ointment is that the Government has seen fit to insist that schools buy the whole package and not just the hardware micro, must qualify for the pound-for-a-pound assistance offered. When you decide your primary school is going to get a Spectrum under this scheme, as well you have to buy a monitor (55.00), fifteen custom-built trays to hold the lot and a cassette recorder. And the Spectrum

must be a 48K unit.

Of course, what a lot of schools are likely to do is, now that the Spectrum has been approved, look at the price of the package (much after getting a little help from their governmental funds) and wisely decide it much better not would be to buy the Spectrum direct. After all there is hardly likely to be a school in the country buying a computer which does not have at least one television.

At the press conference when it was announced that the Spectrum was an approved machine for primary schools: Kenneth Baker (left), Industry Minister, with Raglan Grieve (right), Clive Sinclair, Research

Doodle-bug

Here's the perfect way to while away those long summer evenings — with a ZX81 doodle-bug written by Paul Morris of Alford, Lincolnshire.

The computer prints a number which can be guessed around the screen with the arrow keys. This is not very unusual or original as far as I know, but looks what happens when you press a letter key. It is displayed on the screen where the cursor is.

You can use this to produce interesting patterns of words on the screen, to spell your favourite names, or to pass on messages.

Paul suggests another up variation — to build up words, with any mistakes noted by backspacing with the power. With 1K, you can use 17 lines of the screen.

```

10 LET A$ = " "
20 LET B = VAL "0"
30 LET T = 0
40 PRINT AT Y, X "inverse
  " AT Y, B, A$
50 LET B = CODE B$A$
60 IF B = VAL "0" THEN
  GO TO 40
70 IF B < -CODE "A"
  THEN LET A$ = CHR$
  B
80 IF B < CODE "A"
  THEN LET A$ = " "
90 X = X + (X = 30) * X
  = 30)
100 LET
  Y = Y + (Y = 34) * Y
  = 35)
110 GOTO 40
  
```

Bargain Books!

Now you have a chance to buy the UK's best-selling ZX81 book at a reduced price

Tim Hartnell the editor of ZX Computing has drawn wide praise for his book 'Getting Acquainted with your ZX81' in its 128 pages you'll find over 80 programs — all ready to run on your ZX81

The book is designed to lead you from first principles of programming right through to the point where you'll be writing your own games and other programs with real confidence. The book is usually £5.95 but, as a special offer to readers of this magazine it can be yours for **£4.95**

Programs in 'Getting Acquainted with your ZX81' include a complete DRAUGHTS game, ZOMBIES, STAR-BURST, BLACK-JACK, ALIEN IMPLODERS and more. And you'll be pleased to know that nearly every program will run without alteration, on the ZX Spectrum

Save £1.00 now on this vital addition to your ZX library.

**THE MICRO CONNECTION, Dept. ZX,
Unit 7, Littleton House,
Littleton Road, Ashford,
Middx.**

I enclose £4.95 for a copy of Tim Hartnell's book
'Getting Acquainted with your ZX81'

AND SPECTRUM FORGET THE GAMES

Forget the games — make your computer work for you to carry out a thorough sort and analysis of FOOTBALL and HORSE RACING data by using a special file approach in selecting which records to delete, printing them on and sorting on. You simply enter the date and all the Professional League teams performance into the Foot Ball Analyst program and it will offer a list of the results of chosen players — GOALS, HITS, etc. and also tell you to enter on your football clipboard. The Horse Racing Analyst program is to provide the form and performance data of all horses in any race and information about the race itself and give a forecast to the result. Two amazing and well documented programs to give endless interest and entertainment for all the family. PLUS the real possibility of getting a big win. Big programs that are easy to operate with only a few instructions. Requires 16K.

Programs for ZX81 or SPECTRUM

FOOTBALL ANALYST £10.00 inclusive (16K required)
HORSE RACING ANALYST £10.00 inclusive (16K required)
*£1.00 overseas

EVER BLOWN YOUR TOP WHEN SOMEONE PULLS THE PLUG WHILST YOU ARE PROGRAMMING?

Upgrade your ZX computer system with the
Microbyte SOFTWARE PROTECTION UNIT

At last the nightmare ending your ZX programming session
feature has been solved. Our unique device can simply plug into
your ZX81 or ZX80 and ensure you're in control whenever power
suddenly begins taking your software.

By using built-in high speed detectors and switching circuitry, peak
efficiency has been obtained to give a typical life of 3 years
whenever power for the ZX81 goes before being cycled
to leave it years (dependent on the number and duration of
emergency disconnections).

Model for ZX81 plus 16K ram systems

OPENING OFFER £7.95

plus 75p p.p.s. (incl. VAT). Make cheques payable to
Microbyte at 15 Worcester Drive, Litchfield, Staffs

Available around 10 days. Users must use batteries type AA
(not supplied).

NEW!

Makes an ideal present or simply a great addition to your ZX-81 Program Library.

PERSONAL SOFTWARE SERVICES, 10 DUND STREET, COVENTRY CV4 9Y

ZX81 OWNERS

LOAD/SAVE 16K IN ONLY 29 SECS

Verify successful saving of programs

• Compatible with your existing records

• No hardware modifications

• No extra power supply necessary

• No more wasted time waiting for programs to

load or save — ideal for business users

All this is now possible with the incredible **GSAVE**

GSAVE COMES IN TWO PARTS

A. HARDWARE — Simply plug the **GSAVE** anywhere after between your loading recorder and the ZX81

B. SOFTWARE — Load the **GSAVE** program before you load a cassette or try to run a program and you can then save + reload a full 16K (including roms) in only 29 seconds e.g. a data transfer rate of 5500 b/sec compared to only 250 b/sec standard ZX81

GSAVE Also gives you a verify function just like the Spectrum which allows you to check that your programs save properly

REVOLUTIONISE YOUR PROGRAMMING NOW

Getting things into order

This program is a useful one if you have to sort a list into order, or to produce an index for a book. There are two versions — one for the ZX81 and one for the ZX Spectrum. The programs are by Tim Hartnell.

The programs appear themselves as they run. The first, longer listing is for the ZX81. It contains an error-checking routine, so that you can watch entries before entering them, and print out the list to be sorted and printed.

The Spectrum version does not contain such a routine, but one could easily be added if you so desire, by moving the routine from line 5000 in the ZX81 program.

Zap! Pow! Boom!

The Psion software company got the big deal that everyone wanted — to become the 'official' Sinclair software supplier. How good is their material? Did they deserve the prize? Nick Pearce takes a look.

And visitors to the computer press and visitors to the DOS1 banners of W H Smith could hardly have failed to notice the extensive range of software recently released by Sinclair. I decided to look at six of the Psion products.

The first of the six is, in my opinion, **FLIGHT SIMULATION**. This is a superb program which makes very good use of the power and the graphics of the ZX81.

You are the pilot of a small high performance aeroplane which must be safely landed. You have a choice of three screen displays: the cockpit display shows the outside world (shown in the upper half of the screen) and cockpit instruments in the lower half (including gauge indicators, altimeter, fuel gauge, rate of climb indicator, air speed indicator and radio direction finding equipment).

The rear shows the position of the runway, various radio beacons, the aeroplane and an altimeter of hills to hinder your landing.

The third display is the visual approach which shows a full perspective view of the runway lights, together with some essential landing indicators.

This display is particularly effective and gives a convincing 'pitc eye' view of the runway lights which change colour with banking and changes in descent or altitude.

The program's instructions are clear and concise. It is well worth getting acquainted with them before flying. I didn't and consequently landed with the undercarriage up and then made repeated attempts to land without using flaps and three top stallings, on my next five flights.

After a little practice, flying becomes easier, and full use can be made of the controls and facilities that were ignored during the period of the first five flights.

An option at the start of the program allows the differing approach to practice and landing: just the basic runway approach and landing. If you find flying becomes too easy — which is most unlikely — you can introduce additional complexity by adding wind effects.

I have just two criticisms of **FLIGHT SIMULATION**. I would have liked to try the land at radius of 1 which is not possible with this program; the program prevents the pilot to cheat and fly at ground level (zero altimeter reading) as the runway approach (apart from three points) I could not find the software. At £5.95, it represents very good value for money.

Incidentally, a friend kindly lent me a ZX81 flight simulator on his family computer. In many respects I found the Psion simulation superior: both its visual effects and its navigational facilities were more convincing, and it was more user-friendly. The latter version does have some additional features, however, including take off and landing, and a wingman facility.

SPACE RAIDERS is a ZX81 version of the traditional arcade game **SPACE INVADERS** in which you defend the earth from successive armies of invaders.

You have three lives (lives and points are awarded for each level) and **RAIDERS** may be played on one of three speeds: normal, fast and super fast and I was told by an experienced player who'd won a go that it leaves the most difficulty to the arcade game when it is played in the super fast mode which was too fast for me.

This program is similar to the many other invaders programs on the market, but has the bonus of a second game, **BOBBER**, on the B side.

In this, bits, type games you use bombs and rockets to an

attempt to see a spaceship fly to the ground before your plane either crashes, or is knocked out by the heat from one of your own rockets. It is a probably impossible to completely obliterate the code I tried to win several times at the slowest speed (and there are three speeds altogether). But, a particularly enjoyable game I thought, but one which makes it extremely strange from invaders.

A few 4-wheel touch to

RAIDERS and **BOBBER** is the display at the end of each game which gives the score for that game and the highest score so far. In common with the rest of the software in the review, these programs are pretty well ideal ground, and I haven't could not get within of them to crash.

Both these games perform well, and at £5.95 for the two, this package is a reasonable buy.

Moving on to programs for

the more serious users, the latter range includes **VU FILE** and **VU CALC**, programs needed for business or household management use. **VU FILE** is a general purpose filing program; it is the sort of program you could use to catalogue your collection, keep a name and address list of friends, or the family maintain a membership record for your club or society, or even keep a file record of all your Z801 software.

The program is logically structured and easy to use. You can bring up the record, view headings, titles and picture symbols. Anything entered during the record input mode will be entered on each record on the file. You can move to another file, records, in which you define the parameters on the record what you wish to see the information.

Data is entered into the file from the above-mentioned mode as well as **ORDER** for other main commands are **ALTER**, **INFORM**, **FORWARD**, **BACK**, **PRINT**, **ORDER**, **PRINT**, **CONF**, **SELECT**, **QUIT**, **USE** or **DELETE**. These provide a comprehensive file handling capability and can be referenced simply by typing in just the first letter of each command.

The commands are pretty much self-explanatory, but even there is some difficulty in deciphering a few. The instructions give a fuller explanation.

The top of the screen gives continuous prompts to guide the user through the system. Located on the left side of the screen is an example of an application of **VU FILE**. It is called **GAZETTEER**, and as it is full of records for every county in the world, giving the name of the country, its capital, its main language and the like.

I made use of **GAZETTEER** to get a list for the metropolitan and metropolitan power of the main program.

You also can call up and move the country in the list almost automatically as well under a record. This seemed to be almost must be constantly called. For example, the USA is listed as **UNITED STATES OF AMERICA**, and Russia as **USSR**. On the command **LIST**, each record in the list is displayed for about one and a half seconds.

In using the commands **FORWARD** and **BACKWARD**, you can step through the file

RESET sends you to the first record. **ORDER** defines the particular sequence required, ordering being defined by the leading alphabetical characters of any of the data fields.

INFORM gives information on the status of the file. As an indication of the capacity of **VU FILE**, the **GAZETTEER** holds records on 182 countries and uses 99% of the space available in the program.

I think this software might better open, not be the quality of the program itself. I wish I thought very highly indeed, but by the experience of not loading the files from cassette. Few people would be prepared to wait for five minutes or more to load a file to deliver the address of a friend or colleague. The **Z801** really needs a disc operating system to be used effectively for this sort of work.

For business, as perhaps school or hobby use where a cassette can be loaded at the beginning of the day or session, and the **Z801** can remove dedicated for some time, **VU FILE** on a cassette might be viable, although its speed may quickly become a limitation.

Although the **GAZETTEER** effectively demonstrates the power and capacity of **VU FILE**, and while it clearly has intellectual value, I think I would prefer to know through a guided tour to get the kind of information the program provides.

VU FILE is, however, a good program, and does all that is claimed for it. The real question, however, is whether it would actually ever be used for all those things you have always meant to do.

The program certainly gives me a better understanding of how computers can be used for organizing data, and the power a computer system can offer.

The technique of attempting to catalogue on **VU FILE** the use of string collection can itself be a worthwhile exercise whether or not the computer eventually replaces your manual records.

VU CALC — a **Z801** version of **MISCALC** — is a program for calculating and displaying tables of mathematical theory. You start with an empty table of 38 columns and a grid of 28 rows by 38 columns. Only a small part of the table can be displayed at one time, but you can quickly move through the table using the arrow keys.

Using simple commands, you can enter data into the boxes, and use formulas to link basic ideas or columns so that the computer can quickly calculate a complete table.

The power of the program lies in the ease and speed with which the table can be recalculated with altered data or different formulas.

There is a facility for saving the program on cassette to order with the completed or partially completed table, and it could easily be used for something like monthly accounting.

As an engineer I was rather disappointed that the program only permits the four basic arithmetic operations (+, -, /, *) to be carried out. Many engineering applications would require logarithmic and/or trigonometric functions as well. For this reason, I think **VU CALC** is more likely to be used as a tool for business analysis, rather than engineering, scientific or statistical applications.

I had some difficulty entering the operating techniques required by the program, and I had to persever to make a work. However, after entering the instructions and doing practice, I found I was able to operate the program quite efficiently.

Once the formulae and titles for a particular table had been developed and entered, it is quite easy to enter the data into the chart from which the complete table can be calculated.

Some care needs to be taken in setting up the formulae and entering data. For example, you must ensure that when operations are carried out the resulting figures can be displayed without problems in the eight digit boxes.

VU CALC could be a useful tool for managing household accounts, although I am not sure it could compare with some of the present financial control programs on the market which are designed for more sophisticated applications.

A lot of effort has gone into producing **VU CALC** and it works well, again with considerable emphasis on user-friendly aspects. However, I feel its field of application is likely to be limited since it rather has between two camps. It is neither a proper financial analysis program nor is it ideally suited for serious use by the engineer or statistician.

For some household ap- plications

tion **VU CALC** like **VU FILE** could prove a boon. You do need a certain amount of dedication to set up and maintain a computerized system, but the result is likely to be well worth the effort.

Had any good fantasies lately?

Finally, on a lighter side is **FANTASY GAMES**, which contains two adventure programs.

On the A side of the cassette is **PRIGLUS SWAMP** which takes you to the moon of **SCORNER'S ISLAND** on the B side.

When you enter the **PRIGLUS SWAMP** you must rescue a person who has been captured by an evil wizard, and then return safely.

The game starts with a map showing your position, along with that of the princess and the locations of several swamps in the rescue area.

The map, which can be called up at any stage, is different for each game. As you move, prompted by requests for compass directions, weapons and treasures are encountered, and you gain or lose points as you fight or flee your way onwards.

This program has been well written and is quite entertaining. However, it is more of a guessing game than a true adventure program.

SCORNER'S ISLAND is a cross between a guessing game like **Swamp**, and a true fantasy adventure. You have been introduced to the island from which you must escape. A detailed map can be called up at will, although the screen goes blank for nearly a minute each time you do so.

You have a vocabulary of some ten words with which you tell the computer what you want to do. All wishes you make are surrounded and shown. Again, there may rather a long time to display the game progress. You are assisted by messages prompted by the computer, and have to deal with the other hazards that should be in the story.

There is supposed to be a great wizard who can help you escape, but I have to admit I never managed to meet him.

Again, an entertaining game although I don't think it was quite to some extent by the length of time it took to create the screen displays. **FANTASY GAMES** costs £4.75.

Revised from VO-CALC

Computer display from FLIGHT SIMULATION

VO-PPT Graphics output

The cassette

Summary

Of the six cassettes I reviewed, I was particularly impressed by FLIGHT SIMULATION. It is a novel and apparently authentic simulation which must have taken considerable effort to compile, and of which I'm proud.

All the programs maintained a high standard and together must represent some of the better software available for the C64.

The price of each is more than reasonable, with FLIGHT SIMULATION being particularly good value.

Each cassette is attractively bound, and well presented, with clear and concise instructions.

None on the cassette has been used. All the programs have been used, as an indication of the excellent quality of the recordings.

I was interested to see that CMC's policy is to ensure that all the programs are not corrupted and should give the user some confidence that the program will run down to the end. I was also interested to see that CMC is not a company in a check on recording quality.

All the recordings are for the C64 and can be obtained from W.H. Smith branches, or from Graham Research, Pickett, Cambridge. Supply QJ15355

ANNOUNCING The BEST Books For Your SPECTRUM

15

It is no longer in the acknowledged feeling of being an 'out-of-the-box' computer. In this book, for precise complete coverage of the way the Spectrum operates, both for BASIC and machine language programming. A special section on the ROM operating system explains you might not find a complete manual as to how to use many of the features present in the ROM. This book is a must for the serious user of programming the Spectrum. Only £2.95.

Over the Spectrum is the book where you discover really do come true! With the full listing of over 30 programs for your Spectrum. This book will show you how to use the computer's potential facilities. Listing games such as Asterix, Chess, Huntar and Spectrum Invaders. Together with various educational programs, programming tips and hints, make this the definitive book for every Spectrum user. Only £4.95.

This title speaks for itself! It is everything you need to understand about Spectrum Machine Language when you are just starting out. A must for all new Spectrum owners. Only £3.95.

After leading the way in Sinclair ZX81 software, we've produced the highest quality, most exciting Spectrum software available. From the three excellent books depicted above to fast-action games on cassette, we're providing the best choice in Sinclair Spectrum software today.

Whether it's for your new Spectrum or ZX81, Melbourne House has books and programs perfectly suited to your needs.

Send for your Spectrum or ZX81 catalogue today

MAIL ORDER PROTECTION SCHEME

If you order goods from Mail Order Advertisers in this magazine and pay by post in advance or delivery, this publication will consider you for compensation if the advertiser should become insolvent or bankrupt, provided:

1. You have not received the goods or had your money returned; and
2. You write to the publisher of this publication explaining the position not earlier than 28 days from the day you sent your order and not later than 2 months from that day.

Please do not wait until the last moment to inform us when you write, we will test you how to make your claim and what evidence of payment is required.

We guarantee to meet claims from readers made in accordance with the above provisions as soon as possible after the advertiser has been declared bankrupt or insolvent to a limit of £5,000 per person for any one advertiser so affected, and up to £5,000 per receipt of all such advertisements. Claims may be paid for higher amounts, or where the above provisions have not been complied with, at the discretion of this publication, but we do not guarantee to do so in view of the need to set some limit to this commitment and to warn quickly of reader's difficulties.

This guarantee covers only advance payments sent in direct response to an advertisement in this magazine (not, for example, payments made in response to catalogue, or received as a result of answering such advertisements).

CLASSIFIED ADVERTISEMENTS ARE EXCLUDED.

Structured programming

Although the art of programming is not a discipline with a long history, a consensus has grown up regarding the merits of writing programs in a structured way. In this article, Tim Hartnell briefly introduces some of the key ideas of structured programming.

You've probably gone through several stages in the development of your programming skills. After the first, brief struggle with BASIC, you suddenly discovered you could, after a fashion, write programs which ran. They didn't have too elegant. Typically, simulated when you looked at their listings, and friends may have needed a detailed explanation from you before they knew what to do when running the programs, but at least they worked.

There comes a stage when you realise you're going to have to do better than that. But while you may be vaguely dissatisfied with your programs, you may not have much idea of how to go about becoming a better programmer. Here are a few guidelines which may help.

First, have a look at a print-out of your listing. Programs listed by REM statements look better, and are easier to understand when you return to them after a break. Of course, after the days of rudimentary entry, the luxury of REM statements, and if you have the memory, you should include them. REM statements filled just with extra comments are not going to be as useful in investigating each instruction of the program. Comments are unadvised if used too often. Too many GO TOs leapfrogging over other parts of

the program show a lack of directed thinking, make programs run more slowly, and can make them almost impossible to decipher.

It is a very good programming practice, though not the most memory-efficient way to go about writing a program, to have each of the main sections of the program take the data which assigns the variables at the beginning of the loop, the one which prints out the board, the one which works out who has won, and so on in separate sub-routines. The beginning of a listed game program could well look like this:

```

10  REM NAME OF PROGRAM
20  REM ASSIGN VARIABLES
30  GOSUB 9000
40  REM PRINT BOARD
50  GOSUB 8000
60  REM HUMAN MOVE
70  GOSUB 7000
80  REM COMPUTER MOVE
90  GOSUB 6000
100 REM CHECK IF GAME
    OVER
110 GOTO 100
120 GOTO 10

```

As you can see, this ensures that the program actually cycles through a continuous loop over and over again, until the last game instruction, which is the CHECK IF GAME OVER.

endroutine. You can actually write a series of lines like these before you start writing anything else, and even before you know how you are going to actually perform some of the tasks within the sub-routine.

Then you can write the program module by module, making sure that each module works before going onto the next. It is relatively easy to debug a program like this, and far easier to keep an image of 'what's everything in when you do this, that when you just allow a program to move on, less words need.

The listing should be, then, as transparent as you can make it, both for you when present debugging, and for future understanding of what has occurred when it runs. The completed program should still look good. Again, if memory is not a problem, make sure the display is clear and uncluttered. Use blank PRINT lines to space it out, use rules of graphics symbols or whatever to break the screen up into logical sections and so on. Once you have a program writing itself automatically, it is worth spending extra time on the sub-routine which controls the display. Here you'll appreciate again the advantage of having all the display handling in one sub-routine, as it will be easy to know where to go to enhance

the display.

Of course, as we live in a far from ideal world, it is unlikely that every single display command can be contained within one sub-routine. But if you are towards that end, it will make subsequent working upon the program much easier than it might be otherwise.

You can make the program even easier to read by assigning explicit variable names to the numbers which refer to the sub-routines. By this I mean, in the case of the example given a line such as 'then you assign the value of 9000 to a variable called PRINTBOARD and 8000 to a variable called HUMANMOVE. Then, the subsequent call goes on lines like GOSUB PRINTBOARD and GOSUB HUMANMOVE so you know exactly what the sub-routine call will generate. You'll see this in the program SCRAMBL which comes at the end of the article in which the things the program does include moving the bit (BIT) MOVEBALL, 9000, assigning the variables at the beginning of the game (SETUP), and moving the bit (MOVEBIT). This makes programs very easy to follow.

The structured approach outlined also helps you make another use of a good program - to do what you expect to do every time you run it. You should write a program so that every if

650 RUN

```

SCORE IS 1000

you are not present when a third decade is run it for the first time, it performs as expected. This means not only, of course, that it is properly debugged, but also that the instructions which can be referenced within the ADDRESS MAPTABLES subroutines are clear and complete.

The user prompts should be clear to the human operator, leaving whether to enter a number, a series of numbers, a word, letters, a calculation, etc., and so on. The program has to assume that the operator is a complete idiot, and that no matter how clearly the instructions, and/or user prompts are stated, he will not attempt to do things the wrong way. Access examples of these: the entering of data. Map tables in the routines to reject erroneous input from the operator are called should be set up to reject a date being entered in a form which the computer cannot understand (such as the month before the last or which is clearly wrong such as entering the 30th of February). You should ensure that, no matter what the operator does, the program does not crash, or otherwise misbehave. This can happen if the program was expecting a numerical input, and the operator typed in a series of a word, or the ENTER RETURN

without entering anything at all. You can get around this by always allowing a string input, going back for another input if the string is (or is not) and leaving the ADDRESS MAPTABLES of the input to handle exceptional forms.

Documentation is an area of programming which is often neglected. It is vitally essential for a program which is intended for publication, and most sensible for long programs which you've written for yourself. At the least, the documentation should include a list of variables, an explanation of the program structure (which should be easy to do if you've followed the "modular" approach advised earlier), and final instructions, especially if the program itself does not contain instructions. A sample run showing the kind of output, and the format and layout of the program outputs is also useful.

Your program should run as quickly as possible. Every time there is a subtable in GOTO call, the computer must search through the whole program line by line to find the specified line number, so placing often used subroutines near the beginning of the program will speed them up considerably. That is why the instructions are often placed right at the end. You do not want the computer to have to waste

through the initialization and execution lines every time it has been told to GOTO or GOSUB looking for the destination or return line number.

Define often used variables first, so they will occupy the early slots in the variable store. The computer will search the store only until it finds the variable it wants, so there is no point in putting it towards the end unless it is absolutely necessary.

Finally, and this is key for the long way to test a program, you've written, call it a friend and sit him or her in front of the TV, and tell them to press RUN without you doing anything, and just sit back and watch. If there is any hesitation, or the program misbehaves, you have then work to do.

- In summary, then:
- Use REM statements
- Make program listing neat and logical
- Use structured programming techniques, considering the program through a loss of subroutines rather
- Use line unconditionals
- Make output display attractive and clear
- Follow all user prompts as clear
- Add "mugshots" of all user input
- Document your programs even if you just make a lot of variables
- Make your program run as quickly as possible
- Test programs by allowing someone unfamiliar with the program to run it

Tim Rogers of Richmond turns his programming skill to solving the problem of messy word output.

This program should give a more professional look to your text.

Surging away into space

Also from Tim Rogers
comes this 1K
'arcade game'.

In this program, you are trying to avoid some very weird, alien asteroids. Your ship has a shield which means you cannot get blown up by shooting stars.

However, you are pushed up the screen by any star with which you come into contact

and that the aim of the game is to stay on the screen as long as possible.

The lower down the screen you are, the more points you score.

The star line used to detect when your ship is about to strike something (PEEK

16399 + 256*PEEK 16399) has been replaced by a line machine code routine. In the ROM statement "True, ROM statement is seven bytes long (that is, seven 8-bit seven characters) after the word PEEK). They are hexadecimal 42, 15, 04, 75, 8, 2 and 201. A2

but CHR\$ 75 can be entered from the keyboard, and so 75 has to be PEEKed in at line 20. You move your ship to the right by pressing any key and shift to the left when you release your finger.

```

1 REM "SURGE"
2 LET H=1
10 PEEK 16399+256*75
15 LET S=H-H
20 LET U=30
30 LET T=200
35 LET P=0
40 PRINT "ST U.P.:"
50 LET P=P+H*(PEEK 16399+256*75)
60 LET P=P+H*(PEEK 16399+256*75)
65 SCROLL
70 PRINT "ST U.P.:"

```

```

80 IF U=0 THEN GOTO 10
90 IF U=H THEN GOTO 200
100 PRINT "ST U.P.:"
110 PRINT "ST CODE "
120 LET S=S+U
130 GOTO 40
140 IF H=5 THEN LET H=5
150 PRINT "ST U.P.:"
160 GOTO 40
170 GOTO 10

```

The ultimate SINCLAIR ZX 81 (16K) & SPECTRUM DATABASE FILING SYSTEM

by DALE HUBBARD

Fed up with boring games — make your ZX81 work for you!
The one you've been waiting for!

Cassette based

Clear menu operation

Facilities include add, search, list, delete, change, total, numeric field, save and load file, file print, etc.

Complete with demonstration file and full instructions/application booklet

Requires 16K Ram pack

Applications:

Recipe file

Stamp card collections

Inventory Control

Employee Data

Record Collections

Magazine article catalogue

May be used for any application where fast access is required to stored information

ZX81 (16K) Educational Software 'O' Levels next year?

Revise Maths and French using your ZX81

O LEVEL MATHS CASSETTES - 3 (16K) programs. First program: Revision and test. Second and third programs and third tests using advanced cassette tape. CP 100000. Help and instructions are given when necessary.

O LEVEL FRENCH CASSETTES - 3 (16K) programs. First program: Revision and test. Second and third programs and third tests using advanced cassette tape. CP 100000. Help and instructions are given when necessary.

PRG1 (16K) with an educational Z80 - 3 (16K) programs in General Knowledge, Reasoning, English and Maths. All questions are fully printed.

ALSO AVAILABLE:

JUNIOR MATHS 1 (8 1/2K) - Long Multiplication, Long Division, Highest Common Factor, Lowest Common Multiple, Fractions 1 & 2, Fractions 3 & 4.

JUNIOR MATHS 2 (8 1/2K) - Area, Perimeter, Simple Equations, Percentages, Sets, Venn Diagrams.

JUNIOR ENGLISH 1 (8 1/2K) - Meetings 1, Meetings 2, Weather, Personal Stories, Poems, Stories, Anagrams.

JUNIOR ENGLISH 2 (8 1/2K) - Maths, Revision 1, Revision 2, Stories, Short Stories, Story Ideas, Claps.

ADDITIONAL FOR THE JUNIOR'S - Full National Maternity (16K) offers for entry of up to 1000 students in large type. (16K) also as when enough copies come.

\$ Magic Dollar Seeds \$

In this game, you are trying to outpace the computer, which behaves in a fairly intelligent way to try and trap you. As you move around the board, you leave a trail of seeds. Moving back onto a seed causes four dollar signs to appear around you. Moving onto a dollar sign adds \$100 onto your score. You move by pressing the 1, 8, 7 or 6 keys; moving in the direction of the arrows on those keys.

Thinking is all this is that each time you move, the computer digs two holes (shows either 25 to 5 up or 50 to 100) and usually makes a hole. If you accumulate 1000 seeds, you are dead. However, you have one last out: If you've managed to accumulate \$400 or more, you can press the 5 key, and four dollar signs will appear around you, so the game continues. However, your tally will be decreased by \$400, so the game can continue for some time.

THE EXHIBITION YOU CAN'T AFFORD TO MISS

Mastering machine code on your Spectrum

Toni Baker, author of 'Mastering Machine Code on Your ZX81', turns her attention to the Spectrum with this article, the first in a series designed to take you through machine code from its very beginnings to its ultimate conclusions.

vide to Spectrum is a tiny little black box which, compared to a 286, is tiny. In fact the 286 is only part of the entire computer, not actually classed as thinking. In particular, the 286 is the computer — the ROM is not a computer — the ROM just carries a computer program. The 286 is a single-chip language not a MACRO code. It does not speak BASIC. When you ROM a block, you're not really programming it at all. You're putting a program in the ROM which tells it to do, or what it either does in the ROM and then talks to outside devices.

bluebird code) has written just a bit in BASIC, but they're not ready to compile. The program is called A B C D E H and it can't do any more programs than D to 255. It's easier to work in Pascal than in P, so that from the start — 000 means D and H means 255. In Pascal there are 256 lines: 0 1 2 3 4 5 6 7 8 9 A B C D E F. In P, letters limit to 26, so other letters mean some other line first. But the numbered digits — leading zeroes are characters not symbols — number 0000 T means line three, covering lines back to 0000, all the same — (values in P are 0, so it's not exactly bigger than 255, but it's bigger than 255). In P, some number 037 is a bigger number than 000.

It is not necessary to change the character of the decision itself -- it

is better to get a single "feel" for the size of a number in base 10 without actually knowing what it is. After all, that's all we do in decimal too. But you can't integrate a pile of (numeric) twenty-three pennies.

A variable in machine code can therefore hold any number between 00 and FF, a machine code variable is called a **REGISTER**. There are no zero tests in machine code, and so if you try to add up two numbers whose sum is more than FF you will get the wrong answer in a register, it will be 100 then less than that (the real answer) - the last two digits will be the only ones that count. Take a look at the table (bottom) of machine code.

13 A, 14 B.—This is like a Lift state machine. Register A now holds the number 5A.
15 A, 16 B.—In machine state you can only do one thing at a time—you cannot say any 10 A or 10 B. So you could not say 10 B. What value does the A register now contain? The answer is 23. Try to do the adding again here. A plus 2 equals 2 more. If 5 plus 1 plus the carry value 2 equals 1, then there is "lost".

Regulars can also be used in pairs. The only combinations allowed are BC, DE, and FG. If B contains 01 and G contains A.7 then we say that BC compares 01A.7. This is a four digit base

interval number. Its slope is in fact only just a bit bigger than 6000, and is at least 7000. Strictly speaking, if μ contains 1004 we say that μ contains 1.2 and 1.4, not 1.34.

How do we actually use machine code?

When the 2003 census comes out, hopefully there will be a few last-born males (and possibly one or two females) left. Until then, however, the UNFPA will have to do some "backfilling." Each female needs an individual birth number, even if it's not a "real" number, as a U.S. statement in 1942-43 said: "The number is a bit of nonsense in Myanmar, it is nothing more than the number of 41 villages in which the family at the questionnaire is located." Source: <http://www.unfpa.org>. Few-digit numbers mean so that it's easier to write to land SC with Thai-style numbers or call a 988 (000).

The words we use for the situations are sometimes called **OP CODES** (Operators Codes). For every Opcode there is a HEX code, and for every HEXcode there is an Opcode.

The computer needs the HLXcodes in its program. Numbers on the other hand find it easier to use the OFcodes. When writing down a machine code program on a piece of paper we usually therefore write BOTH versions next to each other — like this:

Here `CO` = `HexCode` which the computer will understand. `RET` is our way of writing a `RET` means `RETURN` either `Return to BASIC` or we shall use only shortly or `Return from a subroutine` which I shall cover in a later article.

Keep entering code programs you write until you reach a RET instruction.

The meaning of USF

USP is a function in BASIC, the very much like a cross between a GOSUB statement and user-defined (mathematical) functions. The very much like a function is the parameter USP *X* has the same "shape" as SIN *X* or INT *X*, and can be used in exactly the same circumstances. But if SIN *X* would the height of a sine wave of junction *X*, and if INT *X* equals *X* with all of its decimals removed, what number does USP *X* give us? And how USP *X* gives us the value of the BC register. A machine code program to run many times USP is used, and the number of samples or whatever after the two-word USP must be the address of the start of a program in machine code. For example, consider the machine code address:

```
Q1:0000          LEAQI 0000
C9:             RET
If X were the address of the "Q"
in the above, then what number
would U004 X give us? RET
Remember, main's return to
RASC, and so BC ends up as
zero in this case. U004 X would
give us 0 value of zero, so PRINT
U004 X would print 0, and U007
Y = U004 X would assign Y with
zero, and so on.
```

The next problem is how do we get the machine code into the computer in the first place? The only way to do it is with a BASIC program. Take a look at the program in Fig. 1; it's called HEPLO, and it will explain what it does and how it works.

The first line is a *user-defined* function which turns a string identifier into a number (in effect it to turn '0' into 0, '1' into 1, and so on until '9' which becomes 9. In addition 'A' becomes 10, 'B' becomes 11, and so on until 'Z' which becomes 35. In addition, 'a' becomes 36, 'b' becomes 37, and so on until 'z' which becomes 71. In addition, 'S' becomes 72, 'L' becomes 73, 'D' becomes 74, 'U' becomes 75, 'I' becomes 76, 'O' becomes 77, 'N' becomes 78, 'E' becomes 79, 'P' becomes 80, 'M' becomes 81, 'C' becomes 82, 'K' becomes 83, 'V' becomes 84, 'W' becomes 85, 'H' becomes 86, 'R' becomes 87, 'F' becomes 88, 'J' becomes 89, 'G' becomes 90, 'Y' becomes 91, 'X' becomes 92, 'Q' becomes 93, 'B' becomes 94, 'T' becomes 95, 'A' becomes 96, 'Z' becomes 97, 'I' becomes 98, 'O' becomes 99, 'N' becomes 100, 'E' becomes 101, 'P' becomes 102, 'M' becomes 103, 'C' becomes 104, 'K' becomes 105, 'V' becomes 106, 'W' becomes 107, 'H' becomes 108, 'R' becomes 109, 'F' becomes 110, 'J' becomes 111, 'G' becomes 112, 'Y' becomes 113, 'X' becomes 114, 'Q' becomes 115, 'B' becomes 116, 'T' becomes 117, 'A' becomes 118, 'Z' becomes 119, 'I' becomes 120, 'O' becomes 121, 'N' becomes 122, 'E' becomes 123, 'P' becomes 124, 'M' becomes 125, 'C' becomes 126, 'K' becomes 127, 'V' becomes 128, 'W' becomes 129, 'H' becomes 130, 'R' becomes 131, 'F' becomes 132, 'J' becomes 133, 'G' becomes 134, 'Y' becomes 135, 'X' becomes 136, 'Q' becomes 137, 'B' becomes 138, 'T' becomes 139, 'A' becomes 140, 'Z' becomes 141, 'I' becomes 142, 'O' becomes 143, 'N' becomes 144, 'E' becomes 145, 'P' becomes 146, 'M' becomes 147, 'C' becomes 148, 'K' becomes 149, 'V' becomes 150, 'W' becomes 151, 'H' becomes 152, 'R' becomes 153, 'F' becomes 154, The game of LIFE was invented by John Conway of Cambridge University in October, 1970. It simulates the birth, death and growth of cells in a closed colony.

Before the state of a cell for the next generation is generated, a complete check, and report of the grid upon which the colony lives is determined. It must be compared with the eight surrounding cells. If there are two or three occupied cells around the one being checked, and the one being checked is occupied, there is no change; it survives till the next generation. If there are three or only two occupied cells, and the one being checked is empty, it is a "born" there in the next

generation. If there are four or more neighbors, the cell being checked "dies," that is, it empties in the next generation.

That is almost all the information you need to construct a game of LIFE from first principles. There is just one more thing — the rules are applied all over the grid at once, so you need one way to hold the current generation, and another to hold the new generation, so that changes for the next generation do not affect cells which have not yet been checked in the present generation. Set up a 10 x 10 grid, and try to work out a program to set these same cells on it. To check each of these cells in turn is second work Conway's

level, and then update a reference array (to copy the reference array into a "print out" array, and to print out the colony and start again).

Here's one way of doing it, which uses two data statements in the form of strings, whose so-called current by statement A(1) in line 30 contains information regarding the numerical relationship of cells to each other (eg, +1 above to the right, -1 to the left and so on). A(1) in line 10 is the position of the starting cell; when the grid is numbered, it is 100. Line 30 contains the following minus sign plus sign equals sign.

sound sign, graphics from the 3 key, graphics from the 2 key, space after minus sign within A(1) in line 10. This is needed for the "data" routine to work.

The ideal school computer

David Valentine looks at the ZX81 and asks if it really is the best machine for schools to use, even at £70.

It is easy to see why the ZX81 is becoming popular in schools. It is a friendly looking computer, not much larger than the more sophisticated large calculator and it has rapidly become a familiar piece of technology due to the extensive advertising of Sinclair. It is easily available through systems such as WH Smith, Griffin and George technical equipment suppliers as well as of course mail order. There can be very few people who have not seen at least a picture of one and many are persuaded out of any scepticism. It is hardly surprising then that just as the video the television and the video recorder have been taken up by schools, so has the ZX81.

Is it then the ideal computer for use in a school? The answer to this must be a very guarded maybe. Certainly I myself use mine just as in a regular home with a great deal of success, but this is only after meeting and overcoming a number of problems. These also seem to decrease as it becomes worthy of serious consideration.

What then are the problems in school? The major factor has to be cost. If the school has very limited funds it is going to afford a number of machines when the ZX81 goes down to £70. It is worth remarking however that no matter how good the value for money, if a device is difficult to use then it is not necessarily such a bargain. A ZX81 is therefore enough to allow home at weekends to suitable pupils

and is of course easily carried even when stuffed in a PET into your schoolbag. The standard keyboard is paper covered having boards spotted on it and having pencils snuffed down it, both unpleasant features in a junior school. Despite its size it is remarkably powerful enough for most conceivable applications in a junior school and for many in a secondary school. The main limitation is the tiny amount of memory available on the standard model and although some very clever programs have been written for the 1K version, I have found that they tend to be not very user friendly in that there is little room for discussion, explanation or error trapping and the risk of garbled results to be increased.

What are the drawbacks to its usage and can they be overcome?

As I have already mentioned it will soon become apparent to a novice user that a manual expansion is required and it is here that we meet one of the major drawbacks of the ZX81. As you are to doubt insert the standard 1K add on memory pack is simply pushed onto the exposed part of the printed circuit board at the back of the computer. This connection has rapidly achieved notoriety for being extremely unreliable. In short, it wobbles and can often lead to loss of program. I originally used a heavy rubber band to hold my RAM pack in place but I have recently acquired a device known as a **WOMERQUITS**. This is a shaped piece of spring steel

which acts as both a base for the computer making it less liable to slide around and also holds the RAM pack tightly against the back of the computer. It has taken about two times of the similar 1K RAM packs currently available and to be less prone to moving around.

In Schools, equipment must be both reliable and safe. I have been very happy that there is no danger to playing fingers, from the ZX81, particularly when the RAM pack is covering up the exposed part of the board. However I am not so happy that the power supply lead is very easily pulled from its socket. A careful teacher will obviously place the leads in such a position that they are away from the children, however I have seen the power and the cassette leads pulled out in a number of instances purely by accident as a result of over enthusiasm. There are a number of ways of overcoming this. One idea

method is to simply tape the plug in place with insulating tape. Another more sophisticated method is to make a wooden support for the ZX81, leaving the leads on the left hand side. The power and the cassette leads are then attached on the side of the box by using plastic plugs such as BNC types, easily available from any electronic shop or 15 components for example. The wiring leads are then cut, they are then soldered onto the back of the new plug. This short lead is now plugged into the ZX81 and now has the BNC male end soldered and can then be plugged into the rest of the box. As this does not affect the computer in any way it should not interfere the guarantee. The leads can, of course, be soldered in directly onto the board, but as this involves opening up the ZX81 it should only be undertaken by someone who knows what he is doing and is likely to invalidate the guarantee.

Much has been written concerning the availability of the loading system. Many in the past have been experienced in the classroom turn to computers and sometimes as a teacher has tried to load a program for the first time, trying "just one more volume setting." Again, an experienced teacher will have experienced with all possible settings and will instinctively know if a program is loading. It is always a good idea to have loaded any program before the start of the lesson anyway!

The keyboard has come in for a lot of criticism, however it has a lot of the advantages involved in schools. Pupils are not taught typists and tend to adapt very quickly to the idea of striking the keys. The keyboard is rather awkward but again I have been pleasantly surprised at the speed with which children have learned while each function is there just that sort of thing up which even quickly then most natural I would add. However, what the lack of lower case letters must limit its use in its current school. Teachers of reading have often up their hands in horror at the thought of having to use upper case all of the time!

I have spoken to people who are concerned with software. Hence for Local Education Authorities and have asked them why they are reluctant to support the ZX81 and it is largely down to the drawbacks I have mentioned. Personally I feel such attitudes are rather short-sighted — the ZX81 has a lot to offer in a school, however simple technology it really classed as a gimmick, and is now passed over by an experienced teacher who has been ill before!

Conclusion

A powerful way to use computers which is without doubt a very suitable machine for anyone who wants to learn or teach the fundamentals of computing for the immediate future. For mathematics and related applications in schools

some thought has to be given to make it as reliable as possible if possible, not to be over-estimated in using it.

MUSE winners announced

Final awards have now been made in the special ZX81 software award scheme, organised last November by MUSE, the educational computing association, to encourage the production of learning programs, and sponsored by Sinclair research.

Well over 100 entries — "the most gratifying response" according to the organisers — were received. Many have been incorporated in the 200 program of the MUSE software library which will now be the largest collection in the largest system.

By Dr David Educational ZX User Group members, and MUSE software winners, Charles Swanton eventually decided to award prizes in only five of the six possible categories: "reflecting", "civilised", "low price quality", "over performance" and "science and maths material".

Prizes of Sinclair ZX81s were won by Dave Fisher of County in the primary maths/science section for "Bomber", by Charles Swanton of MUSE, Chester, under offer primary for "Bomber". Under secondary maths/science in John McMillan of Strathclyde for "Bomber" under offer secondary for Richard Murrell of Kentworth for "Bomber" and under offer for Ian Souter of Tunbridge Wells for "Bomber". No award was made in the mathematics category.

Announcing the results, Dr Swanton expressed MUSE's thanks "to Sinclair for making the awards and covering the costs of the prizes and to the winners for their always constructive and definitive reports".

MUSE is a national organisation for all including primary, primary and secondary schools, teacher training institutions, colleges and other establishments with an interest in the use of micro and microcomputers in any subject area of education. For further information on MUSE please contact Bob Trigg, MUSE Project, Bromsgrove S81 3UT, Wore.

Enough to send you up a tree

James Walsh enters the numerical jungle

Come on, who are they trying to fool? Firstly when you, the jungle, get to do with maths, actually, maths cannot be fun... can it? Well at least it is a little less mind bending than O' level, chemistry or undergraduate electronics.

Jungle maths is written for 'Juniors and Bambioids' presumably between the ages of about 10 and 13 years. The jungle idea is that you are situated in a graphically represented jungle and have to get back to base. If you get a question right then you float on the place. If you get it wrong you lose one of your five lives in one of four event and wonder full ways.

Each step is very well represented by some advanced moving graphics. If you take too long to answer the question, you see a full screen picture of 'yourself' sink into quick sand, and you lose a life.

On side one you have addition and subtraction with three decimals, whole numbers, tenths, two of number. On side two there are multiplication and division with three decimals.

Conclusion

The documentation is good and gives the teacher quite a lot of help. Overall, the package is excellent. I have seen some educational packages on more expensive computers such as the M2802, and the Apple and this is the first time I have seen a ZX1 educational program with graphics anywhere near as good. Personally my only suggestion was that I was tempted to get answers wrong in order to see myself being eaten by snakes or fall into a deep pit. Due to the versatility of the program and the number of screens, it can be used by anyone from the bright six-year-old to the remedial thirteen year old.

Just down SCSDOT, this is very good indeed and I recommend it.

Making connections

James Walsh forecasts the trees for the p.d.b.'s

Here O' levels & A level young giant leap - in the last edition I

The above is a typical screen design of the new Adventure Maths School Software which is designed to take a full syllabus if necessary. The program SCSDOT has proved already 300% reliable of the same type is complete and again can't handle with little fully computerised all the time. The computer requires the lower rate memory mentioned in the article on SCSDOT software.

looked at these O level revision packages. I have now made a comprehensive update to 'A Level with Philip Lawton's 'Resources - Capabilities Transforms' package. This particular package is part of a series of program packages and video materials produced and marketed by Mr Lawton. To put you in the picture, this package is aimed at O' level, A level, NCE programmes and Undergraduate courses in subjects such as electronics, engineering, science and mathematics.

Together with the program which instantly loaded first time, comes a hefty 98 page booklet aimed at giving the user themselves an idea of what the package is all about. The documentation is thorough, well thought out and constitutes a large proportion of the value of the package. Hence I intend to spend a little more time than usual looking through the contents of the documentation.

The first couple of pages give a general outline of the contents, suitable courses and notes on the equipment. Page three gives an index to video recording if you decide to reprogramme (we will come onto this later). Pages 4 through 6 give a basic run down of the program which you will find offering the education to other computers such as the PET.

The remaining 12 pages are dedicated to a script for use either as a guide for the lecturer

when using the program with teacher students or as a script for a video recording. It is a more convenient than having the computer at the back of the screen would be more correct. A pre recorded video is in fact available from Philip Lawton.

Looking now at the actual program, it is approximately 1 1/2 x long and is supplied on a

Q12 cassette. It can be run in three different ways.

(i) Continuously going through each function.

(ii) Continuously going through each function but waiting for a response from the user.

(iii) Flaming particular areas of the programme to demonstrate particular problems.

The software is currently offering two programs: NUMPRAC and SPELL. SPELL is supplied with a supplementary program LETTERHUNT, and necessary Keyboard Overlay.

NUMPRAC is a suite of seven number practice games ranging from 'Count the Blocks' for 4-year-olds to 'Barns' for upper primary, and including 'Mixed Formal' questions in response to recent recommendations. Originally designed as the program with which to introduce computers into a school, NUMPRAC exploits the fact that it provides the use of NEWLINE and the gentle touch on the keyboard.

The program has full input validation, it features word reversal and word graphics and sophisticated teacher control facilities. NUMPRAC does not attempt to teach, it works by positive reinforcement.

LETTERHUNT and SPELL come together on one cassette. They share a common font of bold lower-case letters and a lower case Keyboard Overlay. The typeface in the overlay (Bursell font) was chosen specially to match as closely as possible the characteristics of the letters comparable with ZX81 graphics. The Overlay incorporates a SHIFT key mode.

LETTERHUNT develops character recognition and keyboard familiarity and is good preparation for SPELL.

SPELL is a substantial program intended to develop the quick recognition of words and the ability to rearrange them (it is obviously not a spelling program since it is not concerned with the sound or meaning of words).

The vocabulary is grouped according to word type and is sets from 1000.

The vocabulary is really incidental to the program and words may be added or deleted singly or in groups. This powerful facility enables the teacher to tailor the vocabulary to suit the needs of the class or to extend the vocabulary used by work with new words. The teacher can control exactly which groups are presented to the children or can leave an attempt of choice to them.

NUMPRAC is £3.45, and LETTERHUNT + SPELL cassette, documentation and keyboard overlay is £3.95. Overlays are £1.95 each. £4.00 for 100. ZX Education Software (small order only), 15 Grosvenor Road, Dronfield Woodhouse, Sheffield S19 5PB.

Here is an idea of the kind of image that the ZX81 can produce. It is made from a paper clip and easily developed for programming.

Conclusions

The whole thing has been very well thought out, and the idea of video recording is a feature which the package may appeal to many tutors for more than logging a computer and all the various wires and modules around. Good provision for the student has also been made with extra copies of graphs and

written permission for copies to be made in the purchaser's school or other similar educational establishment.

This is generally a good package and worth considering. Details of other titles are available from:

Getting back to primaries

edzx is a company specialising in educational software for the ZX computers.

Watts that?

This program, written by D. Buckley of Aston-under-Lynne, is ideal for students studying physics, who have to carry out a number of Joule or Watt calculations.

When the program is run, a menu will appear and 'Joules' or 'Watts' can be selected by entering the appropriate letter. All you have to do then is enter the figures, and output comes the answer.

If you wish to save values entered against friction instead of the height lifted, then simply enter the matrix displayed when the program asks for height lifted.

ELECTRICAL CIRCUITS

From Paisley, Scotland, Thomas Ballantyne has sent us a program which was devised to calculate and illustrate — using circuit and phasor diagrams — the characteristics of a series AC electrical circuit. The program is for a 16K ZX81.

The program covers series AC circuits having Resistance and Inductance, Resistance and Capacitance, Resistance Inductance and Capacitance. It has also been designed to cover the case of Series Resonance.

Calculations of Resistance, Impedance, Current, Voltage, Power Factor, Power in Watts, Volt Amperes and Reactive Power are made and the results displayed. A circuit diagram is shown. The circuit has the user next displayed and the values across the components. Values

are to the nearest whole number.

The program can then be used to illustrate the phasor diagram for the circuit. The diagram shows the in phase, and out of phase voltages, and the phase angle between current and applied voltage.

The user is prompted to enter the essential quantities and if a free impedance is to be entered then it should be in Ohms (up to 999 Microhms = 0.0009 Ohms). If there is no

resistive and inductive only, then capacitance should be entered as 0. Even though theoretically this would give a series inductance. The program is arranged to take account of this.

In series Inductors if there is no inductance enter this as 0. No provision has been made for zero inductance, this being an unlikely occurrence. However, if 0 is entered for resistance the program will run normally, until it reaches the stage of displaying the phasor diagram. The diagram will appear on the

screen and a code 0 will indicate an arithmetic overflow.

The program may be run a few or a few. Slow allows the diagrams to be built up, replacing the existing to watch. The program was originally devised to assist in the teaching of this subject to electrical students who were apprentices. A further adaptation is planned to make the student do a lot more work than the computer, the basis of real learning.

Preparing a tape directory for the ZX81

The ability of the ZX81 to SAVE and LOAD a named program on tape opens up new and interesting possibilities. James Calderwood Coleraine, explains how it is possible to load a program from a directory, by just entering the number printed beside the program of your choice.

The obvious way to LOAD a program is to type LOAD "LUNAR" followed by NEWLINE. However, it is possible to use an expression such as LOAD 81 where 81 has the value "LUNAR" or whatever the required program name may be.

```
LET B1 = "LUNAR"
LOAD B1
```

has the same effect as LOAD "LUNAR". Not very useful you may say: how then to type instead of one (but as well as) in the program following this fact can be used to good effect. There is just one other point to understand before we see how to develop a directory program. It may seem that if we call into the expression LOAD 81 we could equally use LOAD 81.6) or LOAD 81(C) well, we could,

except for one little problem: if 81.6) has been interpreted as, for example, 81.112.12) then 81.6) would not be LUNAR but LUNAR followed seven spaces to bring it up to 12 characters in length. This would not be recognised as the title given when the program was SAVED as LUNAR.

This problem is overcome by putting a full stop "." after each program title in the directory. Thus ZX81 will recognise this as the end of the title and LOAD the required program. (You must not, of course, use the full stop in the title when you SAVE the program.)

PREPARING THE DIRECTORY

How you prepare your directory will depend on the amount of

memory at your disposal. The program I have given here uses about 210 bytes, looks at some factors influencing the memory needed, and can how we can adapt the directory to fit 1K if this is the memory available. Here are some economies we can make:

1. The title maximum is lines 10 and 20 are dependent on the number of programs to be recorded on the tape and could

vary from 4 or 5 to 20 or 30, depending on the length of tape used. The minimal requirement of 10 is the recommended length of the title to be used. So the shorter the title we are prepared to accept the less memory needed. I have found that ten lines of eight letters each is 2 + 10 is quite satisfactory and very economical.

2. Once your directory is complete you need not reformat 10 to

To accept for editing, and will explain how this can be done in command mode. This means that you can enter tape values 10 to 30 and 300 to 320. When you RUN this you can enter as many programs as you have on your tape, complete with their starting position. Then by entering 0 the directory will be saved or a single group of tape positions you want the program to save (10 to 70 can now be saved

if you type 0 NEWLINE and, and the rest of the program typed in. You will have to enter as reference to their earlier lines, or give 130 and 0400 TO EDIT and enter line 140 whenever. When you have finished typing the directory the command GO TO 330 will SAVE it at the start of your tape (you've left plenty of room, haven't you?). Now when you type LOAD

the directory will load and then from line 300, printing out a list of programs and asking "PROGRAM NUMBER". When you respond with the number of your chosen program you will be told where to start your tape for your program to be loaded automatically. You may be wondering what to do if you want to add programs to your tape, after all how often do you

start with a tape full of programs? This is where lines 25 to 70 would have been useful.

For those lucky enough to have 128 K RAM packs then it will also do. On the prompt "PROGRAM NUMBER" OR 25 to EDIT" you type 25. You will be asked for "PROGRAM NUMBER". "PROGRAM NUMBER" and "PROGRAM START". This will update your directory and be saved when you reply 0 to "PROGRAM NUMBER". Without the EDIT facility we must work in command mode. To do this LOAD the directory and get into command mode. Type: go
LIST C=1
LIST 50 - LINEAR
LIST 71-100
GO TO 300

Your directory is now updated and recorded.

I find it useful to add one more line to my list of programs in the directory if there is any room room on the tape for additional programs. I enter at the next available number a line such as "PROGRAMS SHUT" and then give the counter reading.

The Program

```
10 DIM A(121)
20 DIM B(12,12)
25 CLS
27 PRINT "PROGRAM
NUMBER"
30 INPUT C
31 IF C=0 THEN GO TO 300
35 PRINT "PROGRAM
NAME"
40 INPUT B(1,C)
45 PRINT "PROGRAM
START"
50 INPUT A(C)
70 GO TO 25
80 FOR C=1 TO 12
90 IF A(C)=0 THEN GO TO 110
95 PRINT TAB 4; B(C), TAB
25; A(C)
100 NEXT C
110 PRINT
120 PRINT "PROGRAM
NUMBER OR 0 TO EDIT"
130 INPUT D
140 IF D=99 THEN GO TO 25
150 FOR C=1 TO 12
160 IF B(C)=0 THEN
GO TO 180
170 NEXT C

Linear programming, and OPTIMAX

Linear programming is a mathematical technique that has been used to solve all sorts of problems, by performing an optimisation on information you supply it. Hiderbay's program OPTIMAX is designed to give the ZX81 owner access to this powerful decision-aiding technique.

With linear programming you tell it how to measure your objective, what values the resources are, and a worksheet listing it in a formula or not, and if it is the best value of the result you can expect, and how to go about getting that result.

The Hiderbay program, OPTIMAX, is written in machine code, which not only enables a sophisticated program to fit in a small space, but makes the program very fast.

The program is supplied with a very detailed manual, which has been prepared with two objectives in mind. Firstly to define how to use OPTIMAX, and secondly, to give somebody with no knowledge of linear programming a guide to how to set about formulating a problem. For those who know something about linear programming already, a section is devoted to supplying the knowledge OPTIMAX is intended, so that they can make use of the program as quickly as possible.

There are many problems, in business and elsewhere, which do not have a unique solution. That rather than asking 'What is the solution to the problem?', we are asking 'What is the best solution to the problem?' Finding the best solution is usually called optimisation. But what does it mean by 'best'?

Talking about best implies that we have an objective in mind. For any formal optimisation we must be able to express this objective in a mathematical form. Normally we are trying to maximise something, for example profit or minimise

something, for example storage costs.

Using to this linear optimisation implies that there must be constraining influences on the solution. If there are no constraints there would not be a problem. Again, these constraints must be capable of being expressed in a mathematical form.

The first stage in an optimisation problem is that to express the problem mathematically. Normally this stage takes the longest time as we have to do just a large amount of information.

Linear programming is just one method of optimisation. For it to be used all relations must be linear. In other words as far as each equation goes, each element must be in direct proportion to all other elements.

The users guide with OPTIMAX has been written with a great deal of care, to aid the user in understanding how the program can be used in general, and how it can be used to help with a typical problem.

For example, here is a quote from the manual, which is a quote under the heading 'Formulating a problem for OPTIMAX'.

The first thing to notice is that all you are doing is creating a model of the problem. There is a direct correspondence between the real life situation and this model. For example, if you are making cattle food and there is a requirement for a minimum amount of protein to be included, then there will be a con-

straint in the model creating minimum protein content. Similarly, the objective of the model corresponds to your objectives in real life.

'You must tell the model how to measure the objective, just as in the real life situation you must have some way of measuring your objective. For example, if you sell slushies and you wish to maximise your profit, you might measure your total profit in terms of the number of each product you sell, multiplied by the profit you make on each one. The equivalent of the method of measurement must be set up in the model.'

Full details on OPTIMAX and the other business programs available from Hiderbay can be obtained by ringing Alan Salmon on 01 485 1058, or writing to: 8110 Parkway, Regents Park, London NW1 3AA, (Telex 22870).

Here is a summary of data items available, and their codes in OPTIMAX.

A =	Creates variable
B =	Assigns variable
C =	Deletes variable
D =	Creates constraint
E =	Assigns constraint
F =	Deletes constraint
G =	Creates usage
H =	Assigns usage
J =	Deletes usage
K =	Use all resources
L =	Use all resources
M =	Use all usage by constraint
O =	Optimise
P =	Copy option to printer
S =	Display variables in solution
T =	Display constraints in solution
W =	Enter all data prior to entering new problem
X =	Solve data
Z =	Load data

Sample output from OPTIMAX

Tracking down those pounds

Not only can you play games in your ZX81, but now, with a number of programs, you can keep track of your personal finances.

Among these programs is the J. P. Gibbons Personal Banking System, which can also be used to check bank statements.

The system can be used to help budgeting and it is designed to be easy to use, even by relatively inexperienced computer users. A number of accounts and features have been built in with this in mind.

The Personal Banking System includes a full page detailed bank account which can be dumped to the printer as well as automatic generation of standing orders and statements, and validation of all entries.

You can correct any item displayed entered with single or multiple find corrections, and enter a previously-omitted item in the correct time order of the account.

You can search for any item or items by cheque number, description or amount. There is a continuous display of statement extracts which is updated continuously during input of entry. A list of standing order details can be displayed, printed, edited or cancelled and amended.

The program is provided with a detailed user manual, and Mr Gibbons gives his telephone after sales maintenance. The Personal Banking System including a cassette and user manual is £9.95. You can get a copy of the manual for £1.00. A ZX81 version, offering multiple accounts, more entries and file options — among other features — is also available. J.P. Gibbons, 14 Avon Road, Chip Ingdon, Kent, BA2 8AX.

Database

Most businessmen and many other activities require the filing of names and addresses for mailing and reference and DATABASE — available from Campbell Systems — fulfils this function admirably.

Almost any kind of list can be screen displayed, but must contain just filing use of name, address, interest date and

tel. — as the standard data to be stored in each record of the file.

The file is maintained by machine code in a way that ZX81 BASIC cannot touch, thus no screen is required until a file is filled with data.

All items and records are variable length, so there is no waste of space.

You start with 128K bytes of file space, and extra 16K above the ZX81 address will be available as well. There are various display formats and search methods.

All file handling, searching and display is done in machine code, so DATABASE is very fast. The program is designed for a crash proof.

The cassette version costs £10.00, is accompanied by a detailed user guide, and is available from Campbell Systems, 15 Wood Rd, Bushwood Hill Farm, BA2 8BX.

Business games

A company called CCS have developed two business games for the ZX81. They are AIRLINE and AUTOCHEF, which are available for £4.75 each.

In AIRLINE your objective is to make through capital by trading in a profit to take over British Airways. You are required to decide on the number of aircraft to operate, whether to buy or charter, the level of staffing and maintenance, whether to enter into long term direct sale for supply of fuel and whether to take loans. Problems encountered are fuel demands, strikes, cancelled flights, hijacks and aircraft crashes.

In AUTOCHEF your object is also to trade profitably, so that the company accumulates sufficient capital (£25 million) to take over Trust House Forte in the shortest possible time.

The quality of the decision making is of even greater importance in achieving the objective than it is in Airline. From information supplied you have to decide on which type of outlet

to operate, the price of the menu, whether to enter into loan contracts or purchase con- signments of food or wines, and the level of advertising, wages and dividends. You are warned that if results and/or debts are insufficient to satisfy the shareholders you will be made bankrupt. There are three levels of difficulty.

Camp Computer Simulations are at 14 Langton Way, London, SE3 7JT.

Video-Plan

Video-Plan, developed by Video Software Limited, is designed to enable the ZX81 to be used as an analysis tool. It performs many functions which could otherwise be carried out using an analysis book and calculator.

Video Plan can be used for such tasks as buying stock records, analysing share prices or invoices, analysing engine data, by financial headings, cash flow, forecasting or production scheduling.

The heart of the system is a user defined sheet stored in the computer's memory (say 50 lines by 20 columns). Data may be added to the sheet and a full range of calculations performed across the lines, together with column totalling and sub-totalling. The TV screen acts as a window through which the chart may be viewed. The run/stop of course, can be moved under user control to any part of the chart.

Dratted VAT

In the last issue we had a copy of programs to help you

The cassette is well designed, with two copies of the program in one side, and a spoken explanation of the Video Plan demonstration included is on side two. The program is very long (14K) and starts running automatically. It takes nearly eight minutes to load. No loading difficulties were experienced.

When you first get the program up on the screen, a menu of seven choices is displayed:

- 1 — set up new sheet
- 2 — define functional lines
- 3 — enter data
- 4 — menu window
- 5 — save the system
- 6 — read chart
- 7 — calculate totals

If you wish to set up a new sheet you are asked to enter the dimensions, lines and columns. A sheet which is too big is rejected by the program.

The program is supplied with a clearly written, detailed 20 page booklet. Although it may appear daunting at first, the demonstration application, along with spoken word descriptions, should enable any careful user to discover the value of the program. In summary, this is a carefully written, well documented, package which should prove a definite asset to a company wishing to carry out any of the tasks mentioned at the start of this article. It is available from Video Plan, 15 Wood Rd, Bushwood Hill Farm, Bathurst, Wiltshire, BA2 8BX.

work out VAT. Reader John Jameson says he can do the same thing these programs do, but more simply. Here's his program.

Sketch Pad

Unleash your artistic frustrations with this amazing program.

With SKETCHPAD you draw on the screen, direct the screen, save the picture on tape or transfer the screen to printer.

The keys to move the flashing cursor are shown when you run the program (instructions start at line 5070). You can also change the mode of drawing (a line or no line) by pressing "N" and "Y".

Note that when typing is line

10, the massive ROM statement you have to type is a number of spaces. To check that you have the correct number, enter PRINT PEEK (16211 + 256*PEEK 16212). This should give 588; it could more, but the extra spaces will not be used. If you PEEK as a class command, 16214 and 16215 with 118; you won't be able to see the listing.

Computer aided instruction

A computer can be quite useful in educational situations, especially when the production of randomly chosen questions is needed. This program which asks the student to identify capital cities can easily be adapted to deal with a variety of subjects.

This program picks 10 countries at random, asking the user to type in the name of the capital city of that country. It gives a display at the end of the round (line 430) then gives the

user the option of either terminating the run, or of going through another 10 questions.

There is no discussion within the program to ensure that the same city is not asked

for more than once in a run. The program does, however, give the correct answer if the student was wrong.

To adapt the program for other subjects, change the

specific questions asked (the routines from line 180 and - of course - the questions) and 'correct' given/for line 1040.

The chess giants grapple

Sinclair Research is selling a chess program for the ZX81, developed by Psion/Microgen. Reviewer Nick Pearce tried it out, and played it off against Artic's Chess 11.

Originally I intended just to review the Psion program, as part of my review of the new Sinclair ZX81 software, but decided that a comparison with Artic's Chess 11 by Artic, last December, would be more appropriate. This comparison, although interesting, is perhaps a little unfair. Chess 11 currently retails at £9.95, while the Psion program, together with CH-802 CLOCK on the other side of the cassette, sells for £5.00 less.

Both programs display the board on the screen, and pieces

are represented by letters. K for King, Q for Queen, B for Bishop and so on, with the colour of the piece being the colour of the displayed letter, however letters for both games

Both games use the standard algebraic system of chess notation for the board co-ordinates, although the Artic program is the only one which actually puts chess co-ordinates on the screen.

The Artic board is always displayed the same way up no matter which and the human is playing from, while the Psion

board is shown with the player at the bottom. I feel this makes the Psion program rather easier to play.

Although I expected to, I did not find the lack of an ordinate display to be a disadvantage, as I found with both programs it was only really possible to play a normal game by having a paper board set up beside the TV screen.

Both programs give you the option of setting up a game position. The Artic program requires you to assign a piece by first defining the co-ordinates, then entering a code for the piece you want there. On the Psion board, you use a cursor (=) to move pieces around the board.

A deficiency with the Psion program for the serious player is the lack of a 'game clock' facility, which the Artic program includes. Psion's also lacks the ability to

print out a copy of the screen at any time, or a list of moves.

Against this, I particularly liked the Psion feature of being able to resign at any time during a four game. If you get fed up with a game on the Artic program, you have to either continue to the last turn, or switch off and wait to start a new game.

So much for the immediately apparent differences between the two programs. I'll look now at how well they actually play.

Both reflect starting and are passed moves, and neither permits illegal moves. I do not play a particularly good chess game, and consequently found both programs hard to beat, even on the lowest levels.

Both games seemed to go for check whenever possible, even if they were not in a position to sustain an effective attack. During one game with the Psion program,

the program repeatedly went for check from a listing position, and was doing so without the necessary volume piece. This left me with an overwhelmed, more active

legs, from which I was able to see easily. However, this was a rather unusual finish to a game against the Polish program. Instead of going to the Polish program, I was

[illegible]

is a good model candidate, small target and simple to build

In order to obtain a comparison between the two programs, a benchmark was for EXBI, and I placed one program against the other.

The levels of play of each program are referred to the time taken to respond to a move, and scored directly comparable between the two administrations.

I must stress that this core person is a little price, as the Poot does not claim to play chess to the standard of the Indian veterans John Jacobs.

As you may have anticipated, the ArtC program played the stronger game. To Peon's credit, three of the four games were held to a draw. ArtC won one. Peon only one.

Both the Facci and the Artic chess programs play a reasonable game. The Artic program plays a stronger, more sophisticated game, and with less noise and more

Living features will be the more attractive for some users. For the casual player, who wants just an occasional game of chess, Pacer is a reasonable alternative. The Pacer program is more user-friendly, and I particularly liked its "escape" facility.

There is little doubt that many Z80 owners will learn a bit more about their computers and the parts of chess through playing against one of these programs.

On the B side of each surface is CHESSE CLOCK. This calculates the clock, used in tournaments to limit the amount of time taken for each move. Two digital readouts display the time taken by each

I thought that CHES & CLOCK would fall of a genre, and unlikely to be used seriously. There might be a few dedicated players who would be prepared to use a Z801 and a television to bring back during serious times.

I thought the Sender advertisement for CHASS-CLICK somewhat misleading. It cannot be used at the same time as the other program that is implied by the statement "can be used at any time" unless you happen to have two television sets and two JVC's.

GAME		LEVEL OF PLAY			RESULT
		TIME	SCORE	AND	MOVES

Making your ZX work

When you're ZX81 gets tired of zapping Invaders, you can put it to work with the following utility programs.

APPROXIMATE DEFINITE INTEGRAL

The program enables you to work out a definite integral by using Simpson's rule. You follow the prompts given, entering the function to be used as line 30.

```

10 REM APPROX. DEFINITE
11 REM DEF. INTEGRAL
12 REM BY SIMPSON'S METHOD
13 PRINT "ENTER FUNCTION"
14 INPUT N%
15 PRINT N% "ENTER X0"
16 INPUT X0
17 PRINT X0 "ENTER X1"
18 INPUT X1
19 PRINT X1 "ENTER X2P"
20 INPUT X2P
21 PRINT X2P "NO. OF DIVISION"
22 INPUT N
23 LET B=(X1-X0)/B=C
24 LET X=X0
25 LET Y=VAL (X%)
26 LET Y=X+R
27 LET Y=VAL (X%)
28 LET Y=X+R
29 LET Y=VAL (X%)
30 LET Y=X+R
31 LET Y=VAL (X%)
32 LET Y=X+R
33 SCROLL
34 IF C<=0 THEN PRINT Q/R/3
35 IF C<=0 THEN GOTO 140
36 LET B=X+R/3
37 SCROLL
38 PRINT "THE ANSWER IS --P

```

Sample run:

```

ENTER FUNCTION
1744-3 ENTER X0
0 ENTER X2P
1 NO. OF DIVISIONS
-0.555575
-0.555575
-0.555575
-0.555575
-0.555575
-0.555575
-0.555575
-0.555575
-0.555575
-0.555575

```

THE ANSWER IS -0.75

POISSON DISTRIBUTION

Using this routine you can determine the probability at a point when we'll call it, and the cumulative probability from zero to it. The computer gives you a value of 0 for M and 0 for K. The probability, it is given at the end as the cumulative probability LPI.

```

30 PRINT "ENTER M"
31 INPUT M
32 PRINT "M = ", M, "ENTER K"
33 INPUT K
34 PRINT "K = ", K, "X = ", X
35 LET B=X+R/3
36 IF B=0 THEN GOTO 140
37 SCROLL
38 POINT "P = ", P
39 FOR Z=1 TO B
40 LET P=P+K
41 SCROLL
42 PRINT P
43 NEXT Z
44 SCROLL
45 PRINT "P = ", P
46 SCROLL
47 PRINT "LPI = ", LPI

```

Sample run:

```

M=0 K=0 X=0
0.14778115 LPI=
0.14778115 0.17361144
0.28760254 0.39346934
0.39346934 0.47309172
0.47309172 0.52013496
0.52013496 0.54206919
0.54206919 0.547773
0.547773 0.547773
0.547773 0.547773
0.547773 0.547773
0.547773 0.547773

```

AREA CALCULATOR

This program works out the floor area of a house, in order to determine how much carpet is required to cover it. Just follow the prompts given.

```
10 REM AREA CALCULATOR
15 LET TOTAL=0
17 SCROLL
20 PRINT "HOW MANY ROOMS?"
25 INPUT R
27 FOR Q=1 TO R
30 SCROLL
35 PRINT "WHAT IS LENGTH OF ROOM"
37 Q
40 INPUT L
42 SCROLL
45 PRINT "WHAT IS WIDTH OF ROOM"
47 Q
49 INPUT W
51 LET AREA=L*W
53 SCROLL
55 PRINT "AREA OF ROOM "Q" IS "
57 A
59 LET TOTAL=TOTAL+A
61 SCROLL
63 PRINT "AND THE TOTAL AREA IS "
65 T
67 IF Q=R THEN PRINT "SO FAR"
69 SCROLL
71 PRINT "IS "TOTAL
73 SCROLL
75 SCROLL
77 NEXT Q
```

Sample run:

```
HOW MANY ROOMS?
WHAT IS LENGTH OF ROOM 1?
WHAT IS WIDTH OF ROOM 1?
AREA OF ROOM 1 IS 100
```

```
AND THE TOTAL AREA SO FAR
IS 100
WHAT IS LENGTH OF ROOM 2?
WHAT IS WIDTH OF ROOM 2?
AREA OF ROOM 2 IS 100
AND THE TOTAL AREA SO FAR
IS 200
```

```
WHAT IS LENGTH OF ROOM 3?
WHAT IS WIDTH OF ROOM 3?
AREA OF ROOM 3 IS 100
AND THE TOTAL AREA
IS 300
```

TYPING TUTOR

This program generates a letter of the alphabet at random and then gives you a limited time to find it. The program will tell you if you're right, wrong, or have just taken too long. Once you've finished it in the present form, decrease the

length of this loopline 1000. The letter here is for the Spectrum, but it is easy to modify for the ZX81. Use upper case A in the loop counter and A in the haven't any choice. Anyway, on the ZX81, change the value at line 130 and 140 into a percentage, and replace the word STOP with the letter G.

```
10 REM SNAKE DOES LOOK FIRST
15 LET S=CHR$(INT (RND*26)+65)
20 PRINT AT 10,0,"QUICKLY, ARE"
25 S
30 IF S=0 AND TO 100
35 LET S=INT(RND*26)+65
37 IF S=S THEN GO TO 140
39 NEXT S
40 COUNT = 1:GOTO 10
42 IF AS=0 THEN PRINT "YOU WERE WRONG"
45 PRINT
```

TAURUS COMPUTER DESIGN

Our UK headquarters is at 100-101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000.

100-101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000.

Our UK headquarters is at 100-101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520

A Picturesque is worth a thousand words

A number of 'tool kits' are available to make it possible to write better programs on the ZX81. ZX Computing staff look at two of them, Screen Kit 1 from Picturesque and Graphics toolkit from JRS Software.

Screen Kit 1 is an attractively packaged screen toolkit from Picturesque, sold by mail order for £5.95. It contains a number of machine code routines to help a ZX81 user speed up his production of BASIC programs.

The routines play and in-sound cards are fully presented in blue, well printed and easy to read. From its arrival, however, I assumed it would LOAD first time but I missed this. On playing back the tape through the load speaker I discovered the signal was a little noisy and was not recorded at a sufficiently loud volume. After avoiding a small piece of tape under the cassette 'U' and setting the highest volume level on the cassette recorder it LOADED first time.

Screen Kit 1 has eight facilities: boundary search, GUS, Screen, GUS, Reverse, Cursor, Memory and SAVE/LOAD.

The SAVE and LOAD facilities are perhaps the most useful, being at double speed. All the routines are addressed from BASIC via USR statements &

PORG commands. The instruction card is A4 size, double ruled and folded in half with compressed text printed in black. In this way Picturesque have managed to get some pretty comprehensive and detailed instructions onto a single sheet.

The first four commands control the screen in the appropriate direction. One PORG adjusts how many words will be actioned before returning to BASIC. For instance, to scroll the screen five times to the left simply PORG 184887.8 then BASIC USR 10000. The unfortunate thing about the scrolls in Screen Kit 1 is that they do not wrap around in the characters lost at the right edge of the screen do not reappear in the opposite edge. Words around words are far more useful in that you can do continuous backscrolls that are definitely moving but do not need to be updated because it wraps around the screen. The principal is quite similar to a 1920s western where the Sheriff would run on a conveyor belt and behind him would be the background painted in a giant canvas that that

usually feel excited like a little girl
and always like the same scenery
to visit, visit, and visit.

Clearly Crashed

Bottom line: I also prefer a C/C++ library which can be used to suppress the discovery of the ROM's routine. Instead of the usually slow C/C++ where the characters can be seen to be transported through the bus to be processed by the ROM, the C/C++ system clear doesn't allow the C/C++ ROM any further access. Unless you pass the ROM's with a charactercode that character will be used instead of spaces in the C/C++ routine. And what creates is a new charactercode for each character at all times. The ROM's will always create each one (ROM's) and then access the C/C++ routine. This program creates the set of defect codes and is very simple and doesn't take a very thorough approach to the pro-

The **RENDERING** routine is quite impressive in that it does a first pass of all the objects, boxes on the screen. You then fix up the rest of the line table and any position of it is up left hand corner and also the height and width, and also the border. This is what you see. The **POINTER** actually results in a lot of data for a single command. It's a simple **CLS** for a single object, or the address, the **POINTER** for the same on those lines in the border. Conversely, clearing part of the screen is not done, just that it is vital not to the **Graphics** package, nor is it done from the user but not that means.

The `draw` subprogram is a useful function. It takes as part of the screen edge image value, which is kept as a local variable in `screen`. It highlights areas of the screen for use then later in `drawdot` color required every time the screen is needed. The first command is a `SCREENOFF` and there is a `color` from 0 to 15.

`SimulatedBUTUT` just gives you a flashing cursor. It will actually highlight a line in a flash on the screen when a key is pressed. The character code of the key pressed is returned. To use that is returned `BUTUT` is not used as it is already connecting. It is used for the screen only.

Young PRINT LOG 18885 returns a figure which is the free memory in bytes. The DAVE to LOAD routines are the most useful part of the package. They operate at double speed and are used for storage of variables on tape. No file names are allowed, but what's out is tape filing systems on a diskette program - what is in is a disk, as a matter of file flow.

[illegible]

That is a pity, as the `SAVE & LOAD` instructions in the machine code monitor (FC/MS) allow single letter file names. When I tried the routines for `SAVE & LOAD` and a similar pattern appeared on the screen, except the last one narrower. The `SAVE & LOAD` routines are a reason to say the depths of the screen.

Plotting Power

The Gains and Loss
Advantages are good and the useful thing is to take time to list variables but take little time to go to the table. **Fig 1**
Perhaps they should have included "Programs to be used" on Screen 10. It is good to see **RMS** statements if business part of your program which has the advantage that it allows it to be loaded without **RMS** if you want to go to work it. But it does mean that if you start a program and decide to use **RMS** you have to load **RMS** if you have it already. It is better than to have a program that will only work in a very complicated procedure which is not in **RMS** is the same case.

Despite this, it's a very useful package overall, and one which will enable you to produce much more professional looking pro-

Graphic Toolkit

Oxygene Toolkit is sold by real-time from PSE-Software at a cost of £5-95. The includes VCL and Postgres. Like Screen Kit 1, it consists of a number of libraries that enables to help the classic programmer create up his

The cassette is a studio produced type and the quality is of a good standard because the signal is processed by the studio. The packaging is not as smart as that of Polaroid but the reproduction is good of two sheets of double sided, compressed A4 as opposed to one. They go to the same depth as Polaroid's recordings but come at a more reasonable price.

The most powerful and useful task is the `diff` command. It

allows the user to define a multi-character shape in a 32-bit color map, and then DRAW or LRS DRAW it at any point on the screen. It will draw a shape whose size actually varies in a user-defined font moving graphics environment. The shape is defined in a ROM using characters that are to be printed, and direction codes to set and rotate each character to be printed. For instance, to define a small square:

1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 2583, 2584, 2585, 2586, 2587, 2588, 2589, 2590, 2591, 2592, 2593, 2594, 2595, 2596, 2597, 2598, 2599, 2600, 2601, 2602, 2603, 2604, 2605, 2606, 2607, 2608, 2609, 2610, 2611, 2612, 2613, 2614, 2615, 2616, 2617, 2618, 2619, 2620, 2621, 2622, 2623, 2624, 2625, 2626, 2627, 2628, 2629, 2630, 2631, 2632, 2633, 2634, 2635, 2636, 2637, 2638, 2639, 2640, 2641, 2642, 2643, 2644, 2645, 2646, 2647, 2648, 2649, 2650, 2651, 2652, 2653, 2654, 2655, 2656, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675, 2676, 2677, 2678, 2679, 2680, 26

[illegible]

A demonstration is provided in the picture in which a grid-based snake moves being a member. Any number of shapes can be defined and used because DOFOG before the GRAPHICS command sets the first number of the shape in shape. The DOFOG command is like the string on the Screen fit: instead of drawing a line, you can draw polygons on the screen. I draw a string on the screen around the edge of the screen with any character.

Only the bottom line contains a variable. This is so you have the choice of using all 24 lines of the screen or leaving the bottom two rows as a sort of "footnote" - **JUSTPRINT** simply removes the word **EDITPRINT** allowing you to use that window - it moves the first position to the top left line which is normally magnified when **PRINT**.

Living Ground

Full access available online at:

SPECIAL ADVERTISING SECTION

eye in the upper portion of the screen
with a circular aperture. The
eye has been at rest for 200 ms.

decides that he's to start filling forms and how many lines total. On this, an excellent example is that, in full-screen mode, you can see the cursor on the bottom of the screen if given an error code. As the usual format Code Line No. An actual error message is displayed. The error message is displayed in the bottom of the screen. The error message is displayed in the bottom of the screen. The error message is displayed in the bottom of the screen.

FOREGROUND mode allows both **FILL** & **REVERSE** - Foreground mode is an only Foreground characters will be changed. Background characters must be typing which isn't a Background character. Sounds change, also! 1 of

Background is set by BACKGROUND ON. This clears the screen to whatever is your choice and selects it as your Background. That is similar to the FAPR system on the Spectrum. The program will then start drawing anything else. For instance you have 38 memory addresses not fully placed on the screen, the Background and some others.

When a **NEWPAGE** command is done with **Foreground** on, the estimate will be changed to ordinary estimate but the **Fullstop** will be left unchanged.

The *Schools* wings around the screen, making some interesting effects possible. I created the effect of moving through space by rendering grayed foliage on the screen. Roving behind the whole screen and then just revealing it, *Schools* is a total far in screen method.

An integrating facility in **ORGANON is OFFORDUM**. They turn the screen on and off; they're not in a FAST mode but by a color and signal which can be used to control the screen.

Congressman

replace the old film for more
than 100 times. But I have
not always used LOAD &
SAVE. I have used it only 10 times.

Don't let its size fool you.
If anything Hewlett-Packard's like the
Tosho.

It may look small on the outside, but
inside there's an awful lot going on.

It's got the kind of features you'd
expect from one of the really big business
models, but at a price of under £200
(including VAT) it won't give you any
sleepless nights.

However, let the facts speak for
themselves.

You get what you don't pay for.
Hewlett-Packard comes with 24K ROM
and 32K RAM, most competitors expect
you to make do with 16K RAM.

What's more, you can expand all the
way up to 2 Mbytes, a figure that would
look out of place on a machine costing ten
times as much.

We've also given you the choice of
255, 320, 512 and 640 x 256 screen
resolution. Whereas most only offer a
choice of 128 x 256 or 192.

Big enough for your business.
Although Hewlett-Packard is not easy on
ABC (and launched a playlet in the field
the power market is a big
For a point.

It comes with HP-BASIC and
BASIC, which should give you plenty of
your 1980's into.

And it also takes CP/M® so it speaks
the same language as all the big business
models, and it's perfectly at home with
their software.

NO OTHER MICRO HAS THIS MUCH POWER IN THIS MUCH SIZE FOR THIS MUCH MONEY.

So as a business machine (usually) comes into town.

The video allows 40 or 80 characters per line with 25 or 30 lines per page giving a very professional 2000 or 2400 characters display on all on TV/monitor. And the keyboard is full sized so even if you're all fingers and thumbs you'll still be able to get to grips with NewBrain's excellent editing capabilities.

When it comes to business graphics things couldn't be easier. With software capabilities that can handle graphs, charts and computer drawings you'll be able to do things that used to be strictly for the big league.

Answering a growing need.

Although NewBrain with its optional onboard display is a truly portable machine that doesn't stop becoming the basic plus a very powerful system.

The Super Expansion Modules come in packages containing 64K, 128K, 256K or 512K of RAM. So hook up to one of the 512K modules to your machine and you've got 2 Mbytes to play with. Another feature that is going to be a surprise on the two onboard ROM interfaces.

With the power of the future.

VLSI gate level silicon is set to run up to 50 million transistors on a single chip and peripherals saving you a fortune in boards.

The range of peripherals on offer includes dot matrix and daisy wheel printers, 8" 10" and 24" monitors plus 5 1/4" floppy disk drives (100 Kbytes and 1 Mbyte) and 5 1/4" Winchester drive (5, 10 Mbytes).

At a special price and a top

design laboratory.

I want to list a couple of extras that deserve a special mention.

The first the Battery Module means you won't be tied to a 13 amp socket. And even more importantly it means you don't have to worry about mains fluctuations wrecking havoc with your program.

The ROM assembler module gives you a freedom of another sort.

Freedom to expand is a beauty. It gives you additional ROM sockets for system software upgrades such as the 250 Assembler and ROMAL. 2 additional video units, analogue ports and parallel ports.

From now on the sky is the limit.

Software that's hard to beat.

A lot of features you'd expect to find

on a professional machine but it's NewBrain so you don't need to worry about connecting matrix BASIC and graphics.

However if you're feeling practical you can always tackle household management - get 800s and educational packages. And for those times that you'd like a mind bending game to while away some time.

While you make time.

To get hold of NewBrain you need go no further than the coupon at the bottom of the page.

With your order we'll include a fully reduction manual so you'll know what to start and a lot of peripherals, expansion modules and software that you'll know where to go next.

Form for ordering NewBrain products. Fields include Name, Address, City, Postcode, Telephone, and a section for selecting products and quantities. The bottom section contains a coupon for requesting a reduction manual.

NEWBRAIN

are not lost when the ZX81 is powered off.

Syntax errors

The syntax of a line of program is checked as entry. A syntax error cursor marks the first place the syntax breaks down if there is an error. The syntax error cursor disappears when errors have been corrected. Only lines free from syntax errors will be entered into the program.

Graphics

Apart from the 20 graphics characters, space and six events, the display may also be divided into 64 x 44 pixels, each of which may be 'blacked' in or 'whited' out under program control.

Editing

A first editor allows you to edit any line of program or input, including program line numbers. Lines may be deleted or created or decreased in size.

Arithmetic

Arithmetic operators +, -, x, /, exponentiate, Relational operators =, <, >, <=, >=, <=, >= may compare string and arithmetic variables to yield 0 (False) or 1 (True). Logical operators AND, OR, NOT yield boolean results.

Floating-point numbers

Numbers are stored in 6 bytes in floating-point binary form giving a range of $\pm 3 \times 10^{-10}$ to $\pm 7 \times 10^{+10}$ accurate to 8% decimal digits.

Scientific functions

Natural logarithms SIN COS TAN and their inverses SIN⁻¹ etc.

Variables

Numerical any letter followed by alphanumeric

String A-Z

FOR NEXT loop A-Z (loops may be nested to any depth)

Numerical arrays A-Z

String arrays A() Z()

Arrays

Arrays may be multi-dimensional with subscripts ranged at 1

Expression evaluator

The full expression evaluator is called whenever an expression constant or variable is encountered during program execution. This powerful feature allows use of expressions in place of constants and is especially useful in GOTO, GOSUB etc. Command mode.

The ZX81 will execute statements immediately, enabling it to perform like a calculator.

Command interface

Work using domestic currents (ac mains). The transfer rate is 250 baud and uses a unique recording format not compatible with other systems. The ZX81 will use the data as well as the program to avoid the need to re-enter the data when the program is next loaded.

ZX81 will search through a tape for the required program. The memory bank supplied have 2 1/2 inch disk packs.

Expansion port

At the rear, the unit has the full data address and control lines from the Z80A CPU as well as CV, HAV, HW, B and the even-odd select lines. These signals enable you to interface the ZX81 to the Sinclair 16K RAM pack and ZX printer.

Power supply

The ZX81 requires approximately 420mA at 7-11V DC. It has an on-board internal 5V regulator. The newly assembled ZX81 comes complete with a power supply. The ZX81 kit does not include a power supply.

TV standard

The ZX81 is designed to work with UHF TVs (channel 38) 625 lines.

ZX SPECTRUM

Dimensions

Width 233 mm

Depth 144 mm

Height 90 mm

CPU/Memory

Z80A microprocessor running at 3.5 MHz. 128K-byte ROM for running BASIC interpreter and operating system. 128K byte RAM (also optional 32K byte RAM on internal expansion board) or 48K byte RAM.

Keyboard

40 key keyboard with upper and lower case with capitals lock feature. All BASIC events obtained by single keys, plus 16 graphics characters, 22 colour control codes and 21 user-definable graphics characters. All keys have auto repeat.

Display

Memory-mapped display of 256 pixels x 192 pixels, plus one or two additional bytes per character square defining one of eight background colours, one of eight background colours, normal or all the brightness and flashing is steady. Screen transfer colour also addition to one of eight colours. Includes a 64K UHF colour (Y, R, G, B) and white and black will give a scale of grey, on channel 35.

Sound

Internal loudspeaker can be operated over more than 10 octaves. Actually 130 harmonics via basic 88KHz oscillation. Jack sockets at the rear of computer allow connections to external amplifier speaker.

Graphics

Point, line, circle and arc drawing commands in high resolution graphics.

16 pre-defined graphics characters plus 21 user-definable

graphics characters. Also functions to yield character at a given position, attributes at a given position (colours, brightness and flash) and whether a given pixel is set. Text may be written on the screen on 24 lines of 32 characters. Text and graphics may be freely mixed.

Colours

Foreground and background colours, brightness and flashing, are set by BASIC INK, PAPER, BRIGHT and FLASH commands. Colour may also be set which performs an equivalent — or option to override any colour or flashing that is already on the screen. The VIBES will give even more colour-gritting. These six commands may be set globally to cover all further PRINT, PLOT, DRAW or CIRCLE commands, or locally within these commands to cover only the results of that command. They may also be set locally to cover line properties on INPUT statement. Colour control codes, which may be accessed from the keyboard, may be inserted into text or program listing and when displayed will override the globally set colours and another control code is encountered. (brightness and flashing codes may be inserted into program or text, similarly). Colour control codes in a program listing have no effect on its execution. Border colour is set by a BORDER command. The eight colours available are black, blue, red, magenta, green, cyan, yellow and white. All eight colours may be present on the screen at once, with some areas flashing and others steady, and any area may be highlighted with light.

Screen

The screen is divided into two sections. The top section — normal — is the first 22 lines — displays the program listing or the results of program or command execution. The bottom section — normally the last 22 lines — shows the command or program line currently being entered, or the program line currently being edited. It also shows the report messages. Full editing facilities of cursor left, cursor right, insert and delete with auto-repeat facility are available over this line. The bottom section will expand to accept a current line of up to 22 lines.

Mathematical Operations And Functions

Arithmetic operations of $+$, $-$, \times , \div and mod to a power, mathematical functions of \sin , \cos , \tan and their inverses, natural logs and exponentials, sign function, absolute value function, and integer function, square root function, random number generation, and π .

Numbers are stored as five bytes of floating point binary — giving a range of $\pm 3 \times 10^{-49}$ to $\pm 7 \times 10^{49}$ (as well as 87 decimal digits). Binary numbers may be entered directly with the built functions: π , \sqrt{x} , \sin , \cos , \tan and mod may be used for constant strings to arithmetic values or variables to help D (data) or T (truth) logical operators AND, OR and NOT yield boolean results but will accept 0 (false) and any number (true).

User-definable functions are defined using DEF FN, and called using FN. They may take up to 25 numeric and 25 string arguments, and may yield string or numeric results.

There is a full DATA mechanism using the commands READ DATA and RESTORE.

A real-time clock is downloadable.

String Operations And Functions

Strings can be concatenated with $+$. String variables or values may be compared with $=$, $<$, $>$, $<=$, $>=$, LEN or STRLEN to give boolean results. String functions are VAL, VAL\$, STR\$, STR\$, LEN and CODE which convert numbers to strings and vice versa, using the ASCII code. A string string mechanism exists, using the format $\text{str}(\text{str})$.

Variable Naming

Numbers — any string starting with a letter (upper and lower case are not distinguished between, and special are ignored).

String — str to ZZ .

FOR NEXT loops — A-Z.

Numeric arrays — A-Z.

String arrays — str to ZZ .

Simple variables and arrays with the same name are allowed and distinguished between.

Arrays

Arrays may be multi-dimensional, with subscripts starting at 1. String arrays, typographically character arrays, may have their last subscript omitted, yielding a string.

Expression Evaluator

A full expression evaluator is called during program execution whenever an expression containing variables is encountered. This allows the use of expressions as arguments to GOTO, GOSUB, etc.

It also operates on commands allowing the ZX Spectrum to operate as a calculator.

Graphics Interface

A line reader is recorded before the information to overcome the automatic recording level fluctuations of some tape recorders, and a software trigger is used to remove noise by playback.

All saved information is started with a header containing information as to file type, title, length and address information. Programs, screens, blocks of memory, strings and character sets may all be saved separately.

Programs, blocks of memory and arrays may be verified after saving.

Programs and arrays may be merged from tape to combine them with the existing contents of memory. Where two line numbers or variable names coincide, the old one is overwritten.

Programs may be saved with a file number, where execution will start immediately on loading.

The graphics interface runs at 1000 baud, through two 3.5 mm disk plugs.

Expansion Port

This has the full data, address and control buses from the Z80A, attached to an interface to the Z80Pins, the RS232C and CDT interfaces and the ZX Microdrive. IN and OUT commands give the I/O port equivalents of PEEK and POKE.

ZX81 Compatibility

ZX81 BASIC is essentially a subset of ZX Spectrum BASIC. The differences are as follows:

Z801 and BASIC like ZX Spectrum operates at the speed of the ZX81 in FAST mode, with the ability to switch to SLOW mode, and does not include these commands:

SCROLL, the ZX Spectrum scrolls automatically, asking the operator "scroll?" every time a screen is filled.

UNPLOT, the ZX Spectrum can unplot a plot using PLOT OVER, and thus achieves unplot.

Character set, the ZX Spectrum uses the ASCII character set as opposed to the ZX81 non-standard set.

MACHINE SPECIFICATIONS

ZX80

Dimensions

Width 124mm (4 1/8 in)
Depth 218mm (8 5/8 in)
Height 88mm (3 1/2 in)
Weight 800g (1 lb 5 oz)

Microprocessor/Memory

Z80A 3.58 MHz clock
ROM: 4K bytes containing BASIC
RAM: 1K bytes internal, externally expandable to 768 bytes

Display

Requires an ordinary domestic black and white colour TV. The lead supplied connects between the ZX80 and your TV's aerial socket. The display organisation is 34 lines of 32 characters per line showing black characters on a white screen. The ZX80 does not connect to a printer.

Programming

Programs can be entered on the keyboard or loaded from cassette. The ZX80 has automatic "wrap round" so lines of program can be any length but not multi-statement lines.

Syntax check

The syntax of the entered line is checked character by character. A syntax error cursor marks the first place the error has occurred. If there is an error. Once any errors have been edited out the syntax error cursor disappears. Only syntax error free lines of code are accepted by the ZX80.

Graphics

Total of 22 graphics symbols giving 48 x 64 pixels resolution consisting of 10 symbols, plus space and inverse. Includes symbols for drawing bar charts. Under control of your BASIC program any character can be printed as screen fill.

Editing

The line edit allows you to edit any line of program or input including apparent numbers. The edit and cursor control keys are EDIT, RUBOUT, HOME.

Arithmetic

Arithmetic operators +, -, *, /, exponentiate. Relational operators =, <, >, <=, >=, <>, <=, >=, <>. Logical operators AND OR NOT yielding boolean result. Relational operators also apply to strings. ZX80 includes over 70 two's complement arithmetic (128000).

Variables

Numeric variable names may be any length, must begin with a letter and consist of alphanumeric. Every character in the name is compared that an infinity of unique names is available.

String variables may be assigned to or from, shortened (but not concatenated). String variable names are A\$ - Z\$. Strings do not require a dimension statement and can be any length.

Arrays have a maximum dimension of 255 (256 elements) each. Array names consist of a single letter A-Z.

Control variable names in FOR...NEXT loops consist of a single letter A-Z.

Expression evaluator

The full expression evaluator is called whenever a constant or variable is encountered during program execution. This allows you to use expressions in place of constants especially useful in GOTOs, GOSUBs, FOR...NEXT etc.

Immediate mode

The ZX80 will function in the "calculator mode" by immediately executing a statement if it is not preceded with a line number.

Cassette interface

Works with most domestic cassette recorders. The transfer rate is 250 baud using a unique tape-recording format. Other systems are not compatible with the ZX80's. The ZX80 also SAV's the variables as well as the program on cassette. Therefore you can save the data for updating next time the program is executed. The ZX80 does not support separate data files. The lead supplied with the ZX80 is fitted with 2.5mm jack plugs.

Expansion bus

An 8-bit bus has 8 data, 16 address, 13 control lines from the processor and Dr. Ss, B11s, 8 and internal memory control lines. These signals enable you to interface the ZX80 to your own electronics, PIO, CTC, SIO if you want. I/O ports are Power supply.

The ZX80 requires approximately 400mA from 7-11V DC. It has its own internal 5V regulator.

TV standard

The ZX80 is designed to work with UHF TVs (channel 36 used as the version required for use in the United Kingdom). The ZX80 USA, is designed to work with a VHF TV (American channel 2, European channel 3) and is the version required for the American TV system, also for countries without UHF.

ZX81

Dimensions

Width 162mm (6 3/8 in)
Depth 178mm (6 1/8 in)
Height 80mm (3 1/8 in)
Weight 350 gms (12 1/2 oz)

Microprocessor/Memory

Z80A 3.58 MHz clock
ROM: Containing 8K BASIC interpreter
RAM: 1K bytes internal, externally expandable to 768 bytes

Keyboard

40 key touch-sensitive membrane. Using function mode and single press key word system, this gives the equivalent of 80 keys and also graphics mode allows an additional 28 graphical and 84 inverse video characters to be entered directly.

Display

Requires an ordinary domestic black and white or colour TV. The serial lead supplied connects the ZX81 to the TV aerial socket. The display is organised as 24 lines of 32 characters with black characters on a white background.

Two mode speeds

The ZX81 can operate in two software selectable modes: FAST and NORMAL. FAST is ideal for really high-speed computing. In NORMAL mode however the ZX81 allows continuously moving, factor free animated displays.

Printer

The 8K ROM will permit instructions (LPRINT, LIST and COPY) to drive the Sinclair ZX Printer.

Programming

Programs can be entered via the keyboard or loaded from cassette. Programs and data can be saved onto cassette so that they

New From Fuller FD System for the **ZX SPECTRUM**

£39.95

+ £2.50 p & p.

Professional Keyboard & Case —

This unit has the same high standard as our ZX81 unit. Tough ABS Plastic case encloses our Keyboard, the Spectrum Printed Circuit Board and the Power Supply.

Our own Power supply is available - 9 volts DC at 2 amps.
Mains either 110v or 240v AC at £5.95 + 80p p & p.

The Keyboard has 42 keys with all the spectrum functions printed onto them, the full travel key switches have gold plated contacts and a guaranteed life of 10⁶ operations.

INSTALLATION - Simply unscrew the ZX printed circuit board from its case and screw it into the FD case, plug in the keyboard and that's it. No technical know-how or soldering required. The built unit is tested and comes with a money back guarantee.
Spectrum Keyboard and Case Kit £33.95

Our Mother Board for the spectrum has 2 slots at £18.95 or 3 slots at £19.95. This unit also has two inside the case. p & p 80p.

SPECTRUM SOUND AMPLIFIER £3.95 + 80p p & p.

Complete with leads, volume control and loud speaker in tough ABS Plastic case measuring 5" x 3" x 1" just plug into your spectrum I/OC input.

SPECTRUM PLUG PLANNER — £18.95 + £1.00 p & p

Complete with 3 metres of cable, three 13 amp sockets for TV, Tape etc AND 0 volt at 2 amp power supply with power jack to fit Spectrum or ZX81.

The ever popular **FD42 Keyboard and case** for ZX81 **£39.95** including VAT & Post.
FD42 as a kit £33.95 including VAT & Post.
FD42 Built only £24.95 including VAT & Post.
FD42 Keyboard Kit £18.95 including VAT & Post.

GUARANTEED 14 DAYS DELIVERY FROM RECEIPT OF ORDER, OR CALL TO THE ZX CENTRE

Mail to **FULLER MICRO SYSTEMS,**
The ZX Centre, Seawing Street, Liverpool 2, England, U.K.
